Network activity, DeFi, stock tokens, and fees

Robinhood Chain: Q3 2026

July 1 to September 30, 2026

Robinhood Chain processed **793.66M** transactions in its first public quarter, close to Base's **797.41M**. Spot exchanges handled **$90.67B** in gross turnover. Quarter-end DeFi TVL was **$1.02B** and stablecoin supply **$1.07B**. *These capital measures overlap.

August 30 to September 10 generated **71.13%** of Q3's **$46.17M** in network fees. After that peak, the final 20 days averaged **8.70M** transactions and **$1.58B** in spot turnover per day. Fees fell from their peak while execution and trading remained above their earlier daily rates.

Business and Revenue

Robinhood Chain opened public mainnet access on July 1. Robinhood operates the rollup using Arbitrum technology; Ethereum provides settlement and data availability. Traders and applications pay ETH for execution. Application operators charge for swaps, lending, and other services, then distribute proceeds to liquidity providers and other recipients.

The Arbitrum ecosystem has a contractual claim to **10%** of net protocol revenue. Robinhood's launch-partner agreement allocates another share of sequencer proceeds.

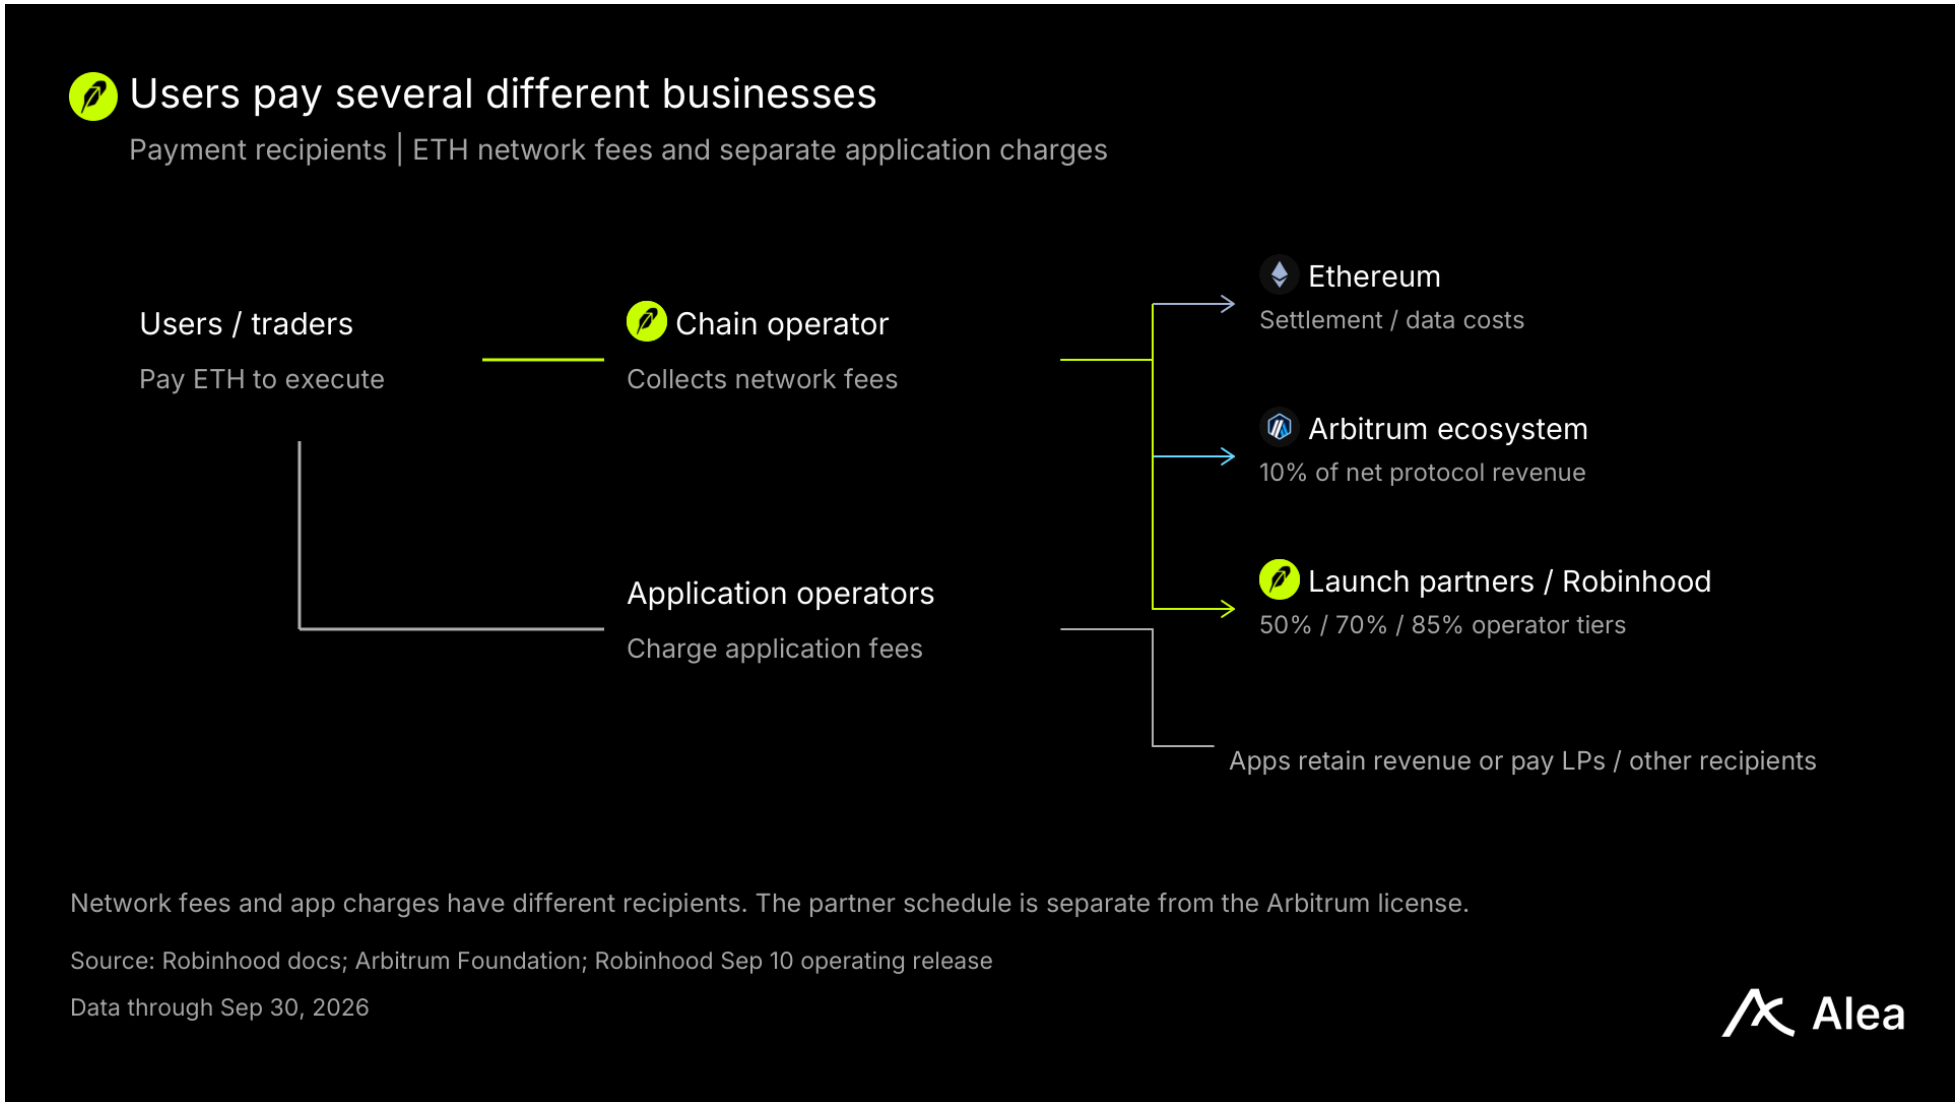

Figure 1. Users pay ETH network fees and separate application fees; several recipients retain proceeds.

Network fees pay for execution and settlement. Application fees pay for services delivered through the chain. The operator, launch partners, application businesses, and liquidity providers receive proceeds under different rules.

A stock token gives exposure through debt securities issued by Robinhood Assets (Jersey), without shareholder rights against the underlying issuer. Authorized participants mint and burn tokens; secondary-market users trade existing ERC-20 balances. Classic Stock Tokens on Arbitrum One are a separate product, excluded from this benchmark.

August 4 was the first **10M**-transaction day. The address count peaked on August 12. Early September brought the fee peak and stablecoin supply above **$1B**. Robinhood disclosed launch-partner terms on September 10 and announced future U.S. agents and perpetuals on September 29.

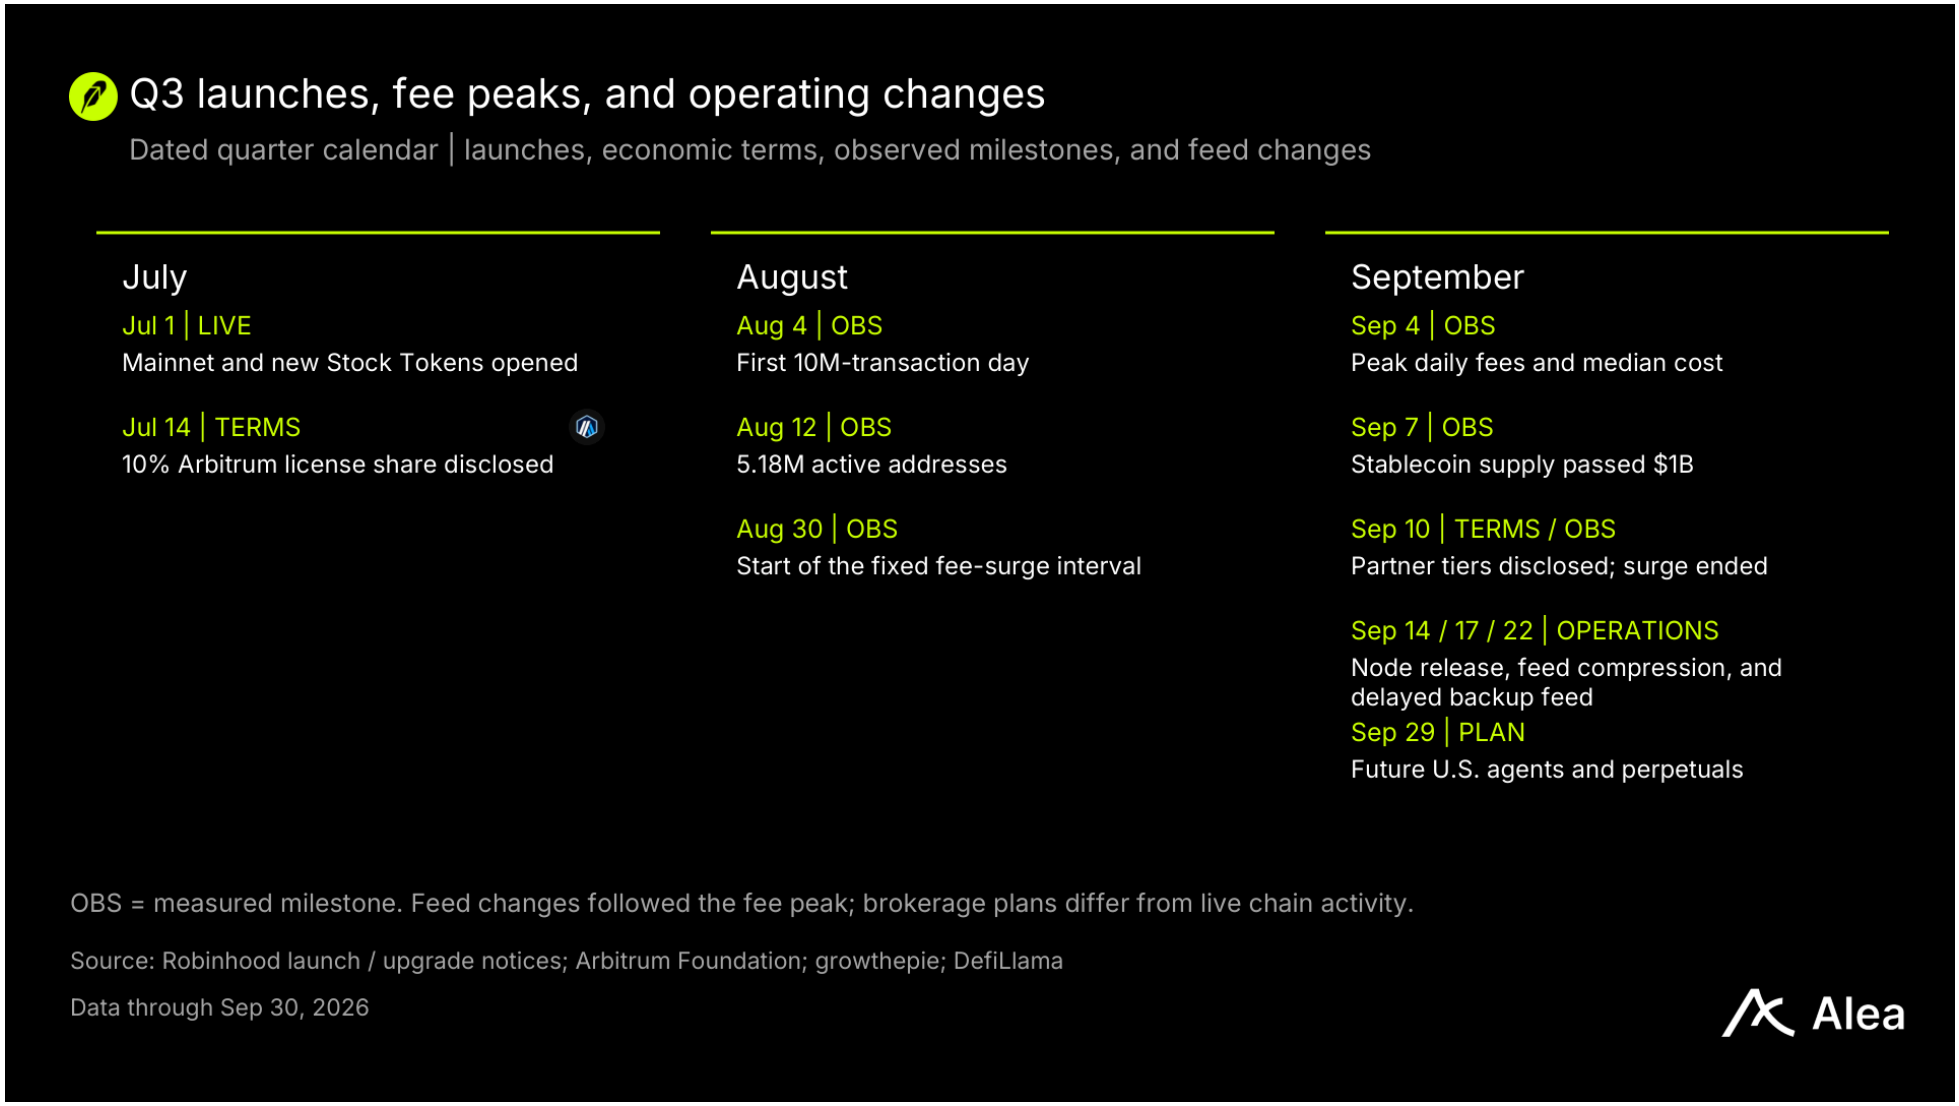

Figure 2. A Q3 calendar places launches, operating changes, and measured milestones alongside planned products.

A September 14 node software release left consensus unchanged. Robinhood switched its websocket feed to compressed-only transmission on September 17 and added a delayed backup feed on September 22. These changes supported node connectivity after the early-September fee peak.

Monthly Performance

Transactions totaled **188.70M** in July, **320.34M** in August, and **284.61M** in September. Mean daily active sender addresses rose from **221.51K** to **569.15K**, then fell to **418.05K**. September spot turnover reached **$55.99B** as transaction counts declined.

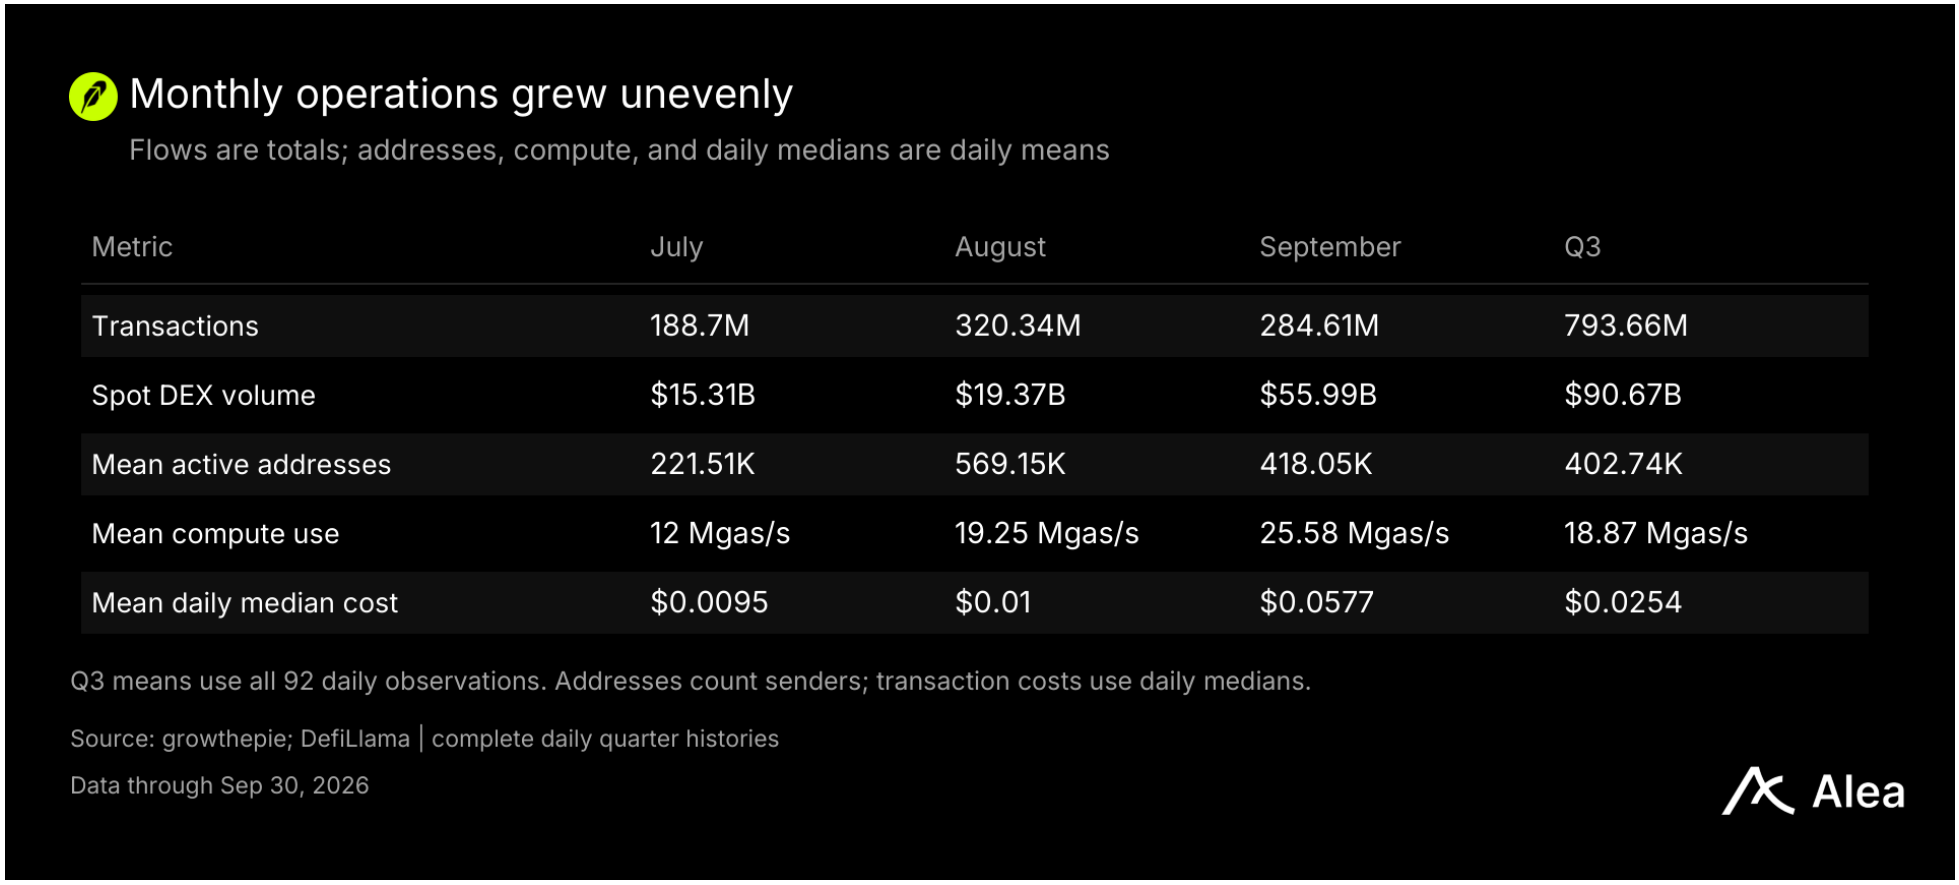

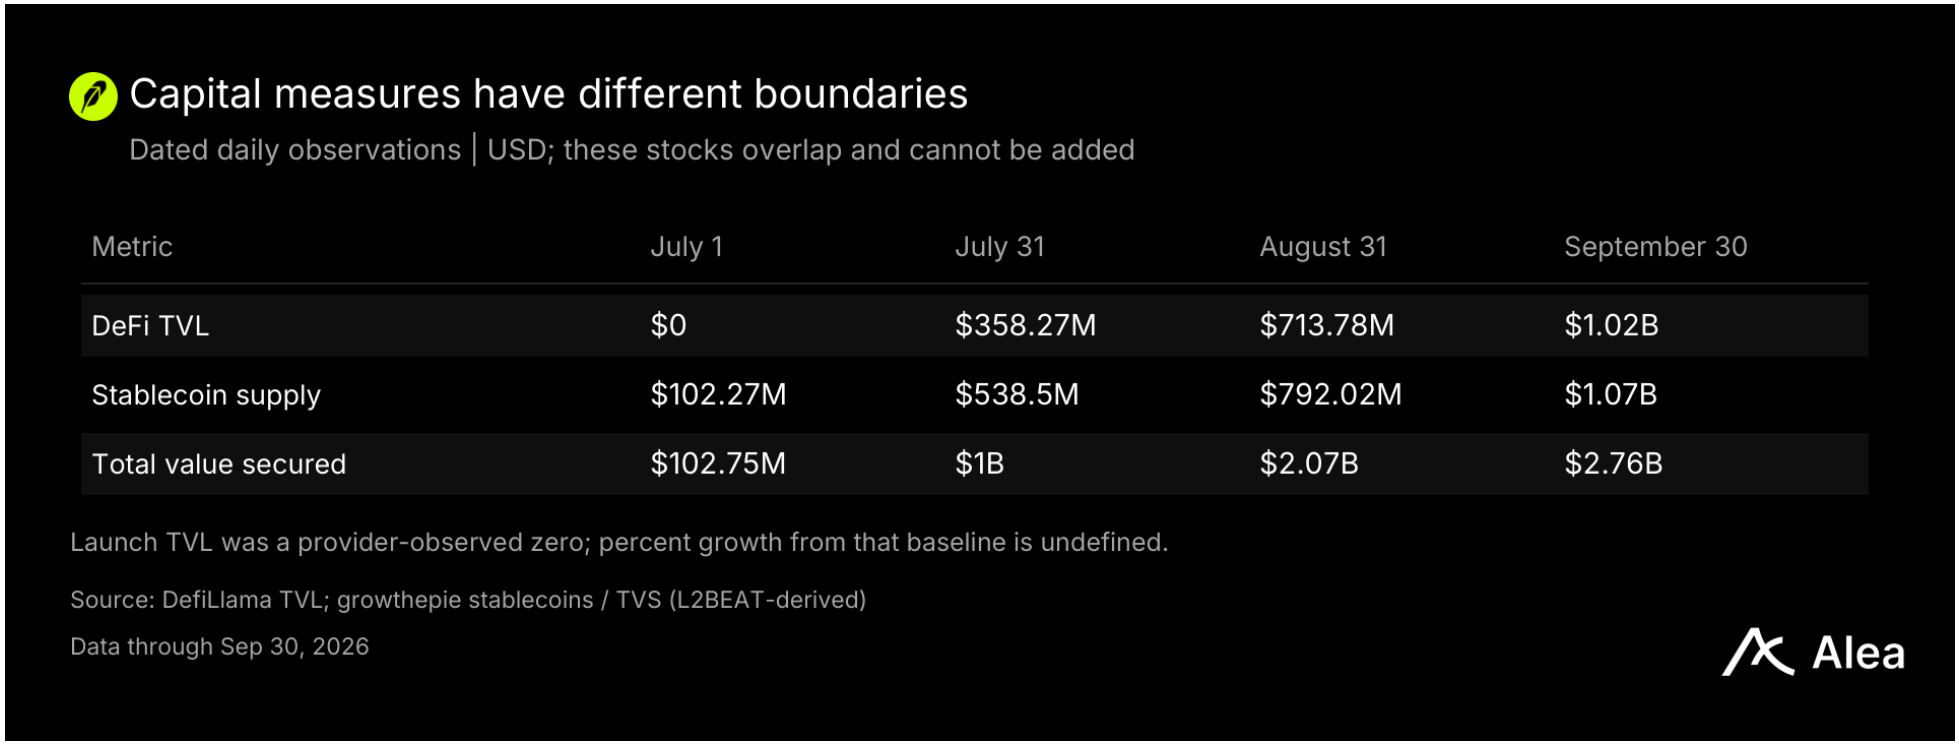

Figure 3. A monthly operating scorecard contrasts transaction and address counts with trading and compute use.

August led execution counts. September processed fewer transactions but used more compute and traded more notional.

DeFi TVL measures assets in protocol contracts; stablecoin supply measures token balances on the chain. Total value secured, or TVS, contains native assets alongside canonical and externally bridged tokens. TVS reached **$2.76B** on September 30.

Metric	July 1	July 31	August 31	September 30
DeFi TVL	$0	$358.27M	$713.78M	$1.02B
Stablecoin supply	$102.27M	$538.5M	$792.02M	$1.07B
Total value secured	$102.75M	$1B	$2.07B	$2.76B

Figure 4. Dated capital stocks distinguish DeFi TVL from broader secured value and stablecoin balances.

TVS includes assets held outside DeFi contracts. Dollar capital balances move with token prices, issuance, and transfers, so balance growth differs from net deposits. The July 1 TVL observation was zero; launch-to-quarter-end percentage growth is undefined.

September applications generated **$355.65M** in gross fees and retained **$86.26M**. Post-license chain revenue was **$32.31M**. Application revenue accrues to app businesses; chain revenue accrues to the sequencer before launch-partner sharing and other operator costs.

September dominated the quarter's fee totals

Monthly and Q3 totals | USD; network and application fees have separate recipients

Metric	July	August	September	Q3
Gross network fees	$3.59M	$6.65M	$35.93M	$46.17M
Post-license chain revenue	$3.21M	$5.96M	$32.31M	$41.49M
Gross app fees	$110.74M	$126.46M	$355.65M	$592.85M
Retained app revenue	$29.11M	$31.14M	$86.26M	$146.5M

Post-license chain revenue precedes launch-partner sharing and other operator costs.

Source: DefiLlama network and application fee / revenue series

Data through Sep 30, 2026

Alea

Figure 5. September accounts for the largest monthly network and application fee totals; retained revenue is also higher.

Application service fees supplied a larger fee base than network execution charges.

September had 30 days, against 31 in July and August. Transactions fell **11.15%** versus August in total and **8.19%** per day. Spot turnover rose **189.11%** in total and **198.75%** per day.

Mean compute throughput increased **32.88%** in September. The mean of daily median transaction costs rose **474.94%**; month-end TVL and stablecoins grew **42.23%** and **34.79%**, respectively.

Figure 6. Signed monthly growth shows September transactions falling while capital stocks and fees increased.

September paired higher capital balances and trading with fewer executions.

Capital Growth

DeFi TVL increased from **$358.27M** on July 31 to **$713.78M** on August 31 and **$1.02B** on September 30.

Stablecoin supply increased from **$538.50M** at July-end to **$792.02M** at August-end and **$1.07B** at September-end. Balances rose through the fee peak, then stabilized near quarter-end.

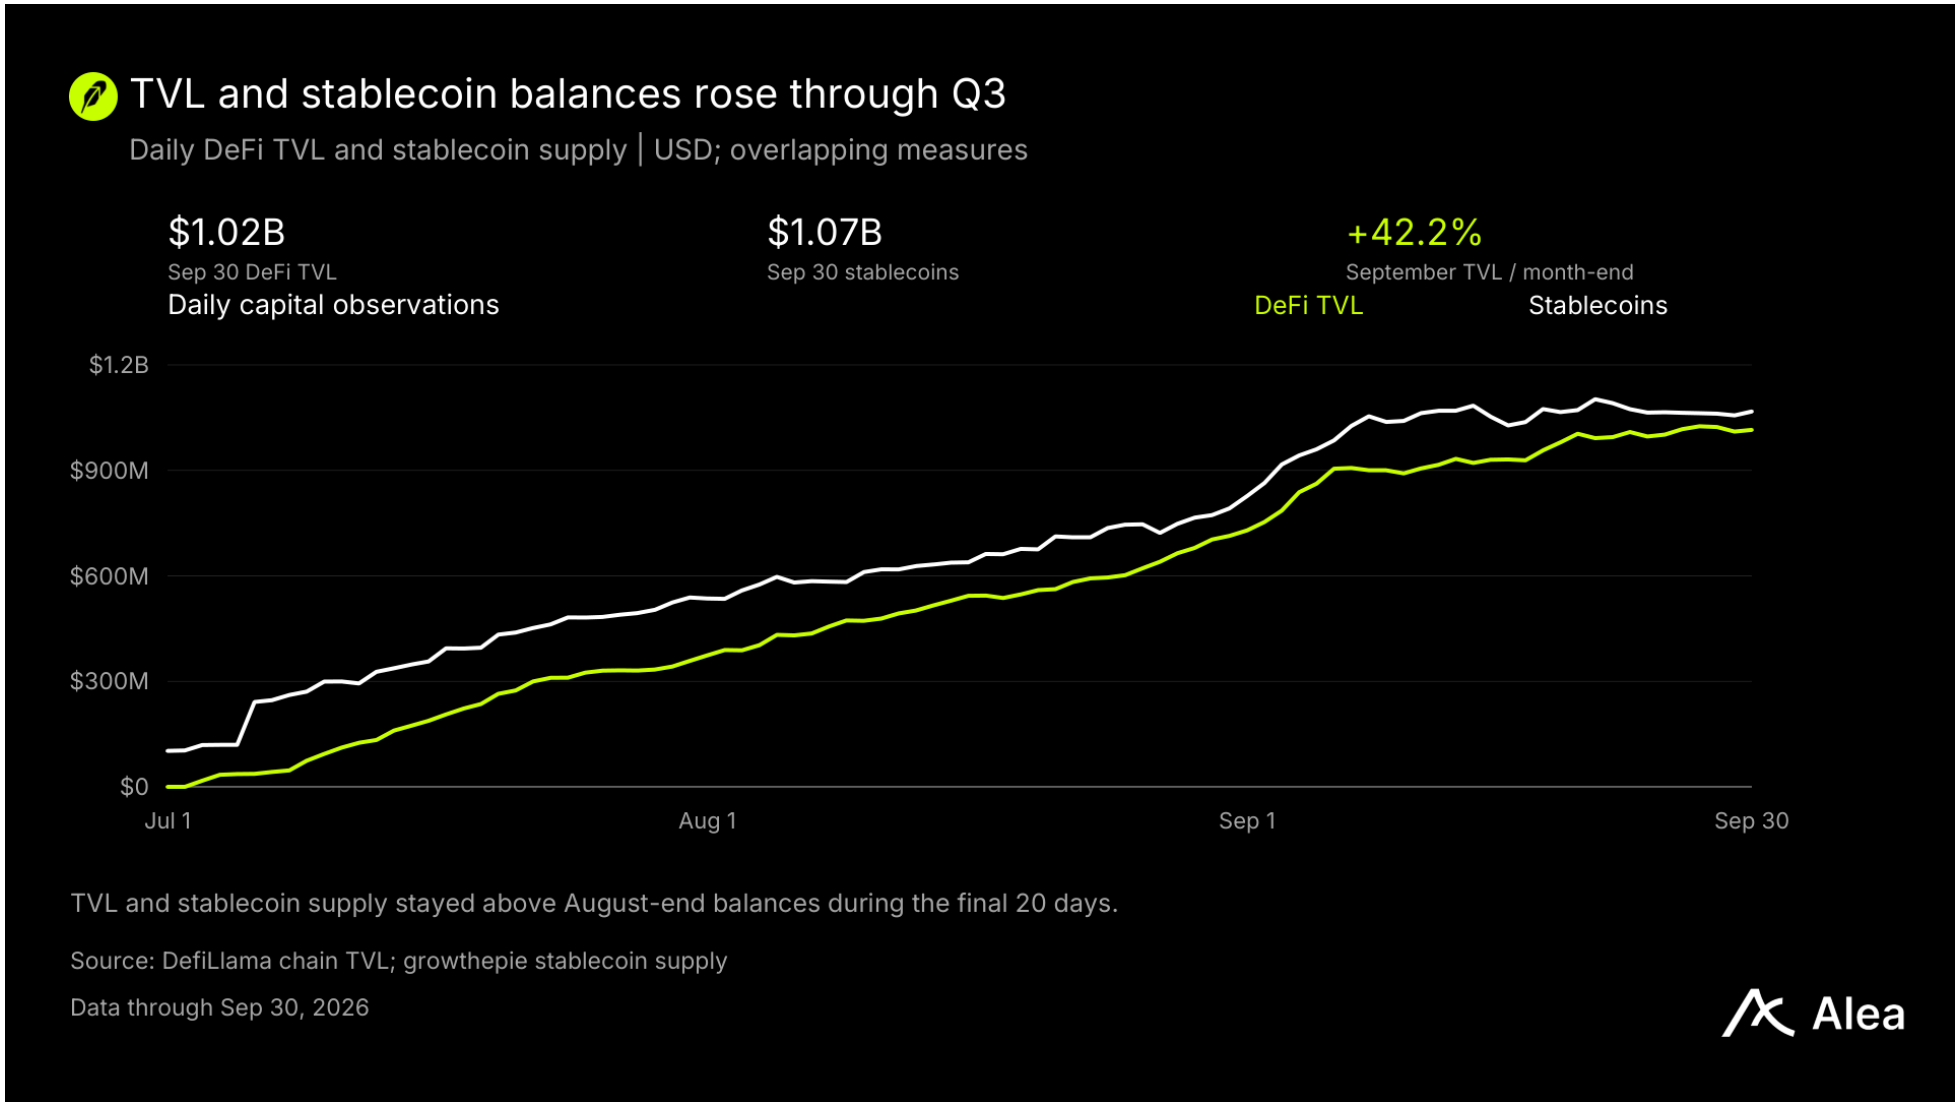

Figure 7. Daily paths of DeFi TVL and stablecoin supply across Q3.

During the final 20 days, TVL and stablecoins stayed above their August-end balances.

TVS ended July at **$1B**, August at **$2.07B**, and September at **$2.76B**. Its September increase was **33.35%**.

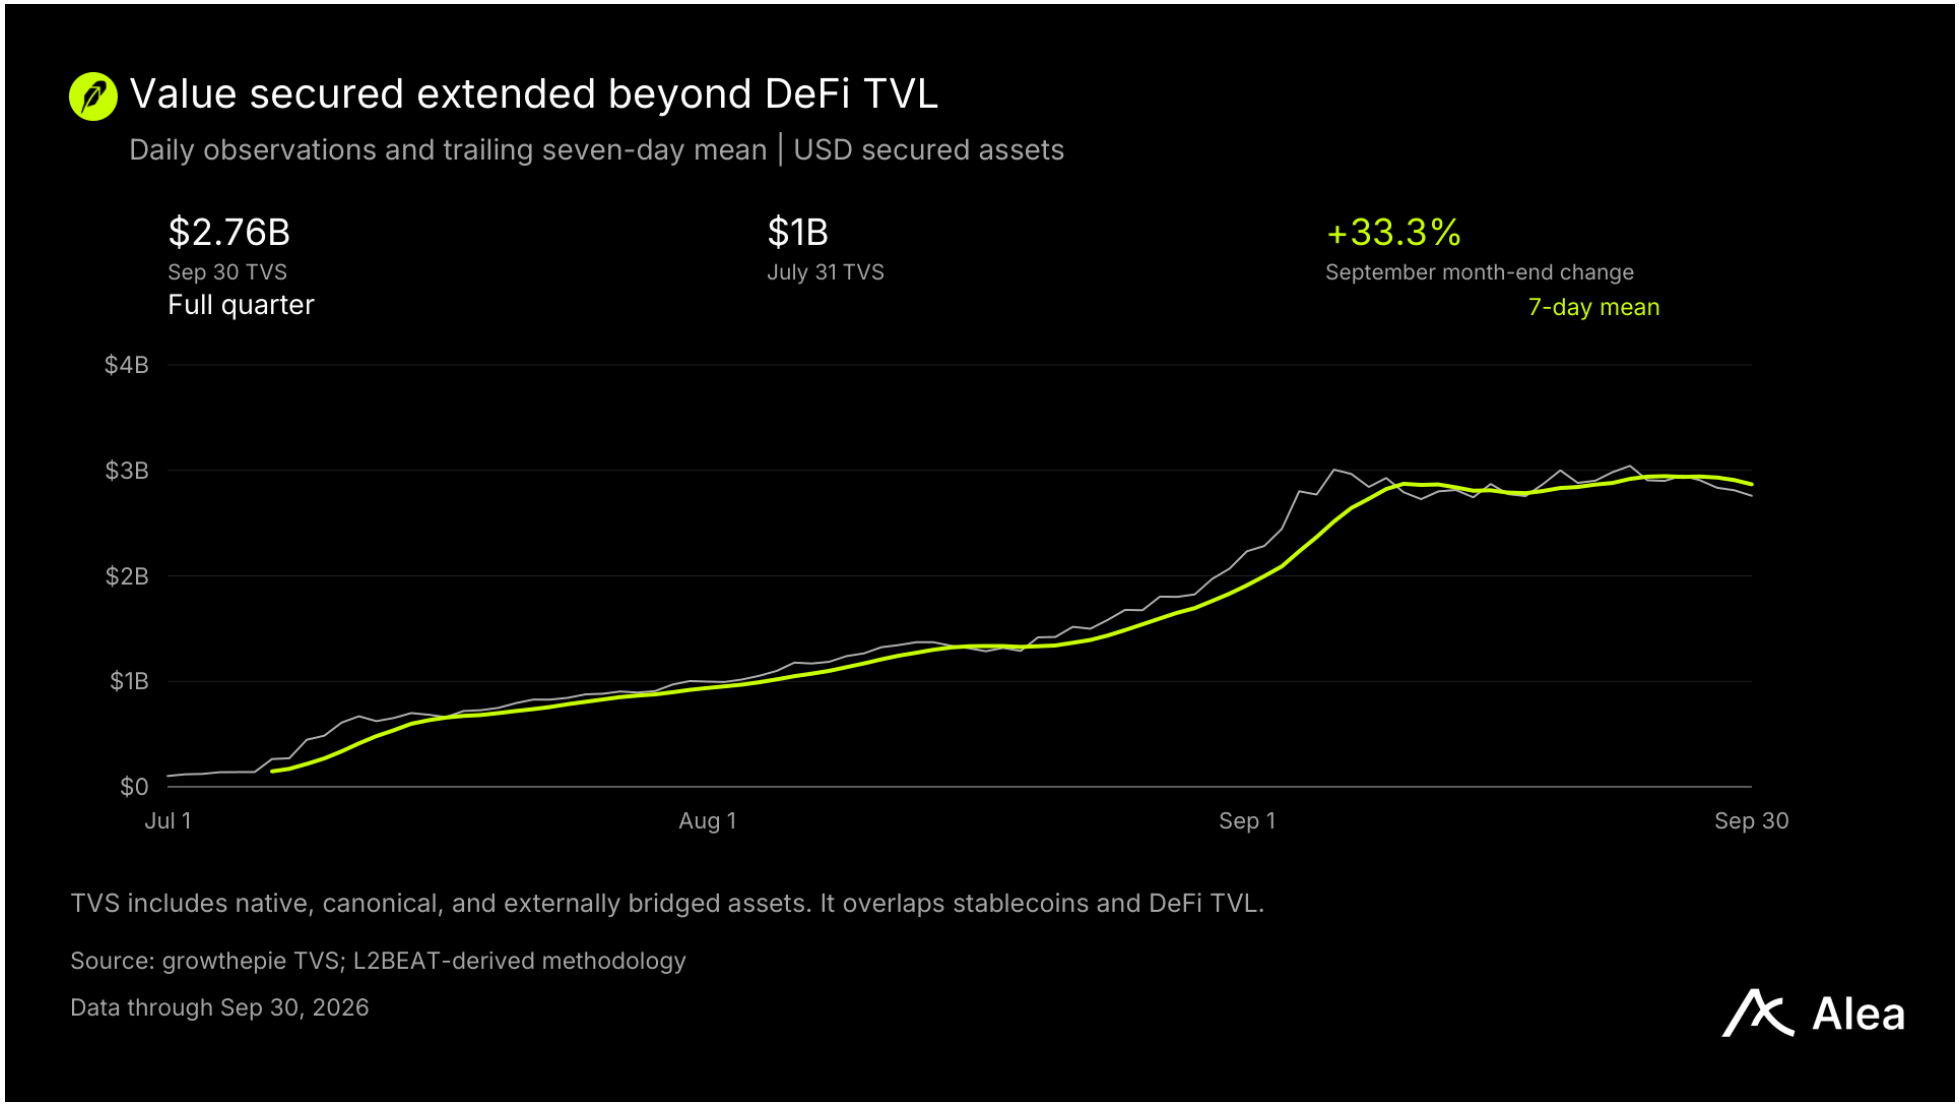

Figure 8. Daily total value secured, including native and bridged assets.

The wider secured-asset balance grew alongside DeFi capital. Its coverage includes wallets and contracts outside the protocols counted in TVL.

USDG supply reached **$683.44M** and USDe supply **$342.64M** on September 30, comprising most of the **$1.06B** stablecoin total.

USDG supplied **83.03%** of the August-to-September stablecoin increase. The remaining balance includes U and smaller tokens.

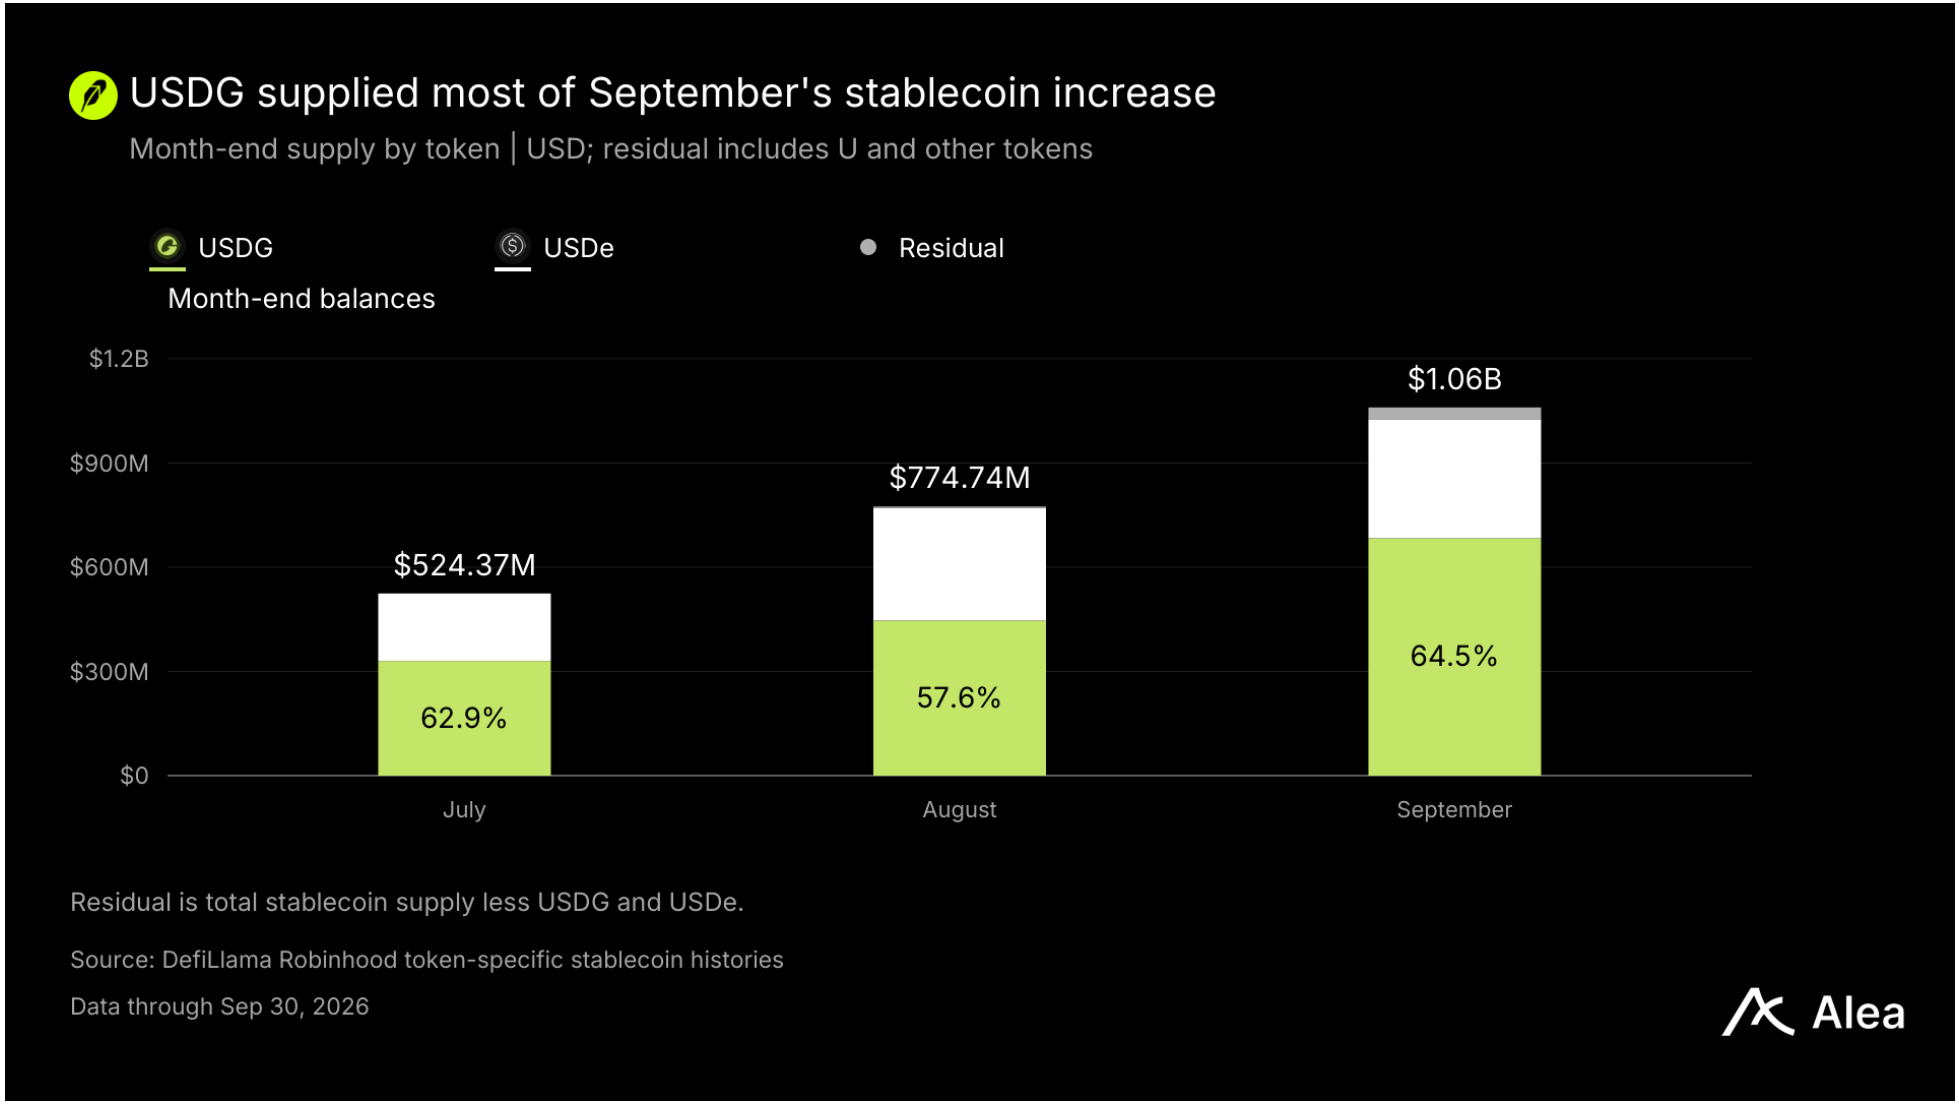

Figure 9. Monthly stacked bars separate USDG and USDe from the remaining stablecoin supply.

USDG increased its share of the stablecoin balance from August to September.

Tokenized Stocks

Robinhood Chain's stock-token program held **$28.12M** on July 31, **$67.34M** on August 31, and **$160.81M** on September 30.

Value increased **139.5%** in August and **138.8%** in September.

The July 1 balance was **$11.87M**. September 30 value was **13.5x** that opening observation.

Figure 10. Month-end stock-token value and growth, with the dated July 1 opening observation.

Issuance and redemptions change token supply; underlying market prices also change its dollar value.

September 30 exposure comprised **$116.19M** in equity stocks, **$28.97M** in ETFs, **$12.83M** in commodities, and **$2.81M** in U.S. Treasuries. Equities accounted for **72.3%** of the stock-token program.

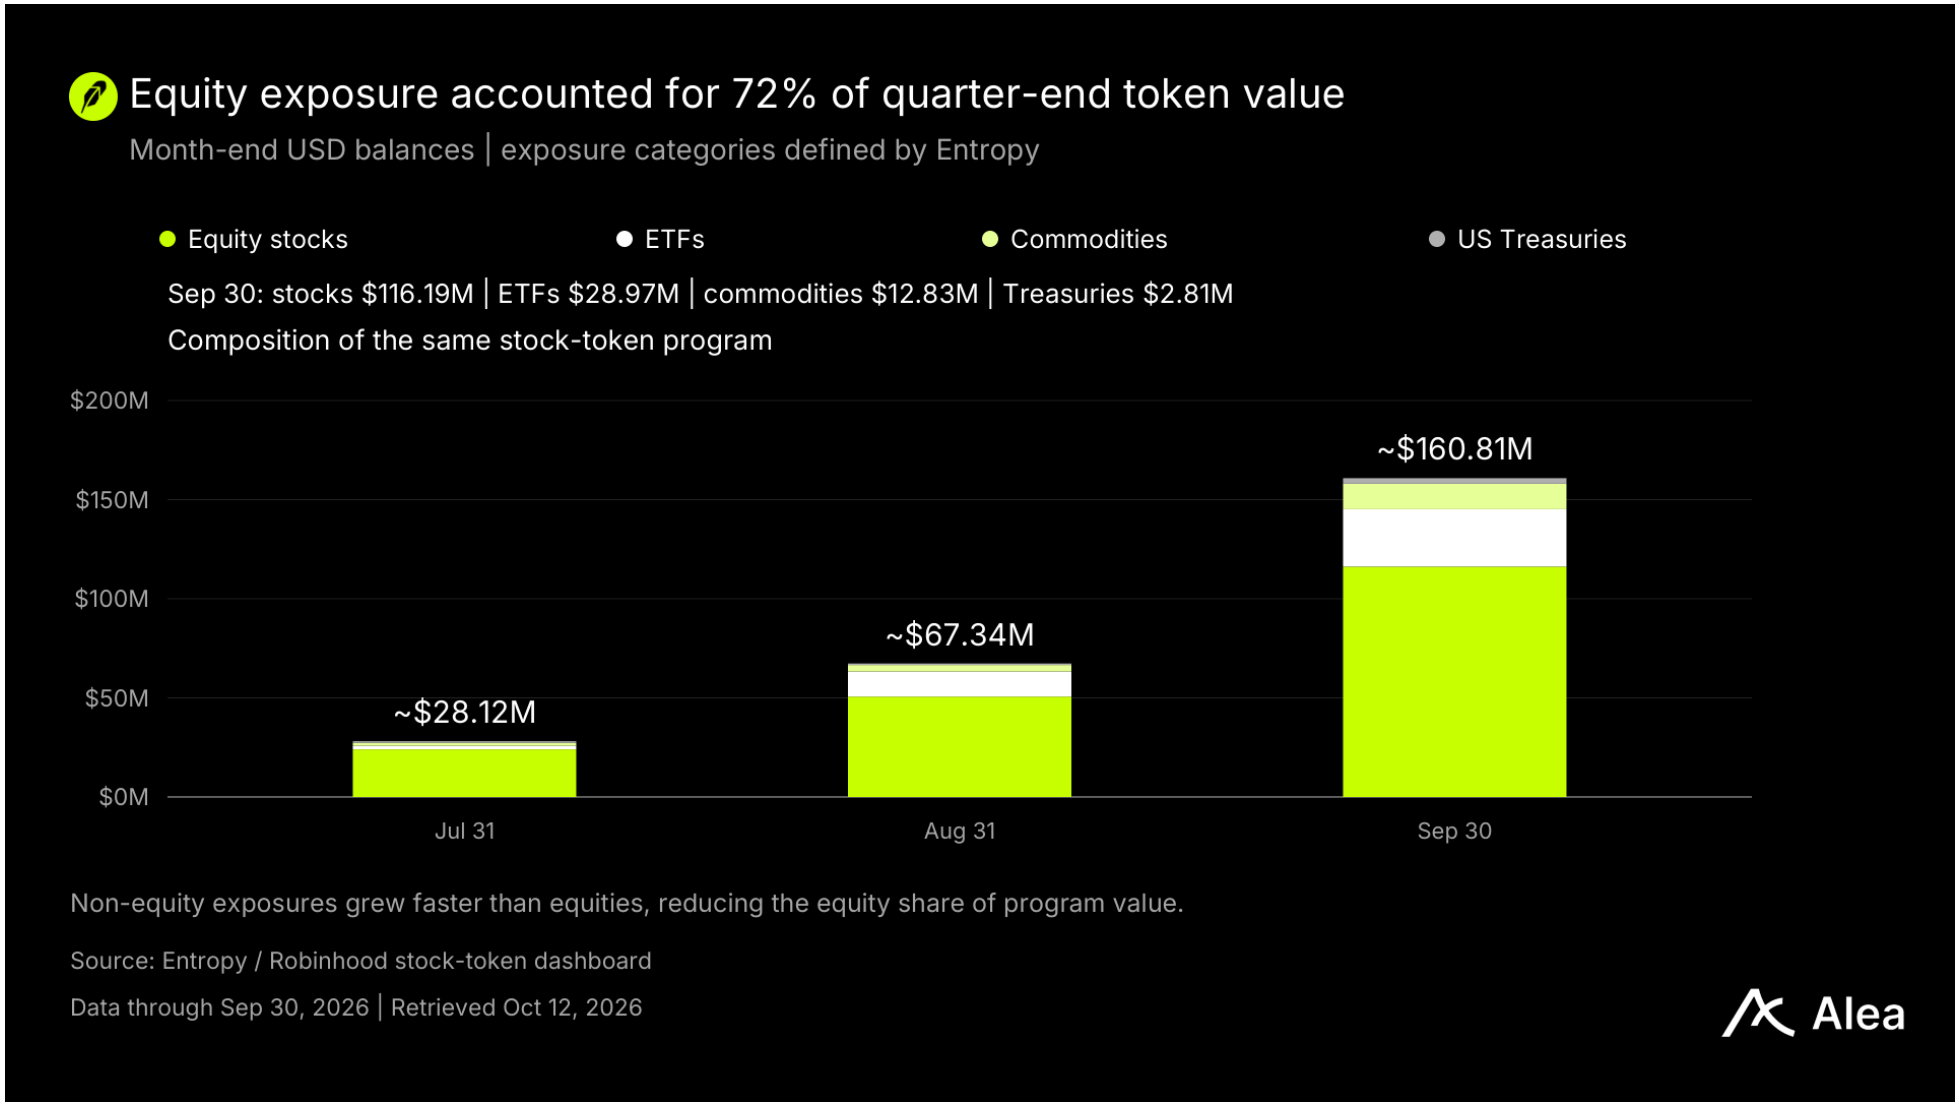

Figure 11. Monthly stock-token value by equity, ETF, commodity and U.S. Treasury exposure.

Equities' share fell as non-equity balances expanded faster.

Stock-token DEX turnover totaled **$542.44M** in July, **$2.32B** in August, and **$11.03B** in September, adding to **$13.89B** for Q3.

August turnover increased **328%** versus July; September grew **375%** versus August and supplied **79.4%** of Q3 turnover. September's daily average increased **391%**.

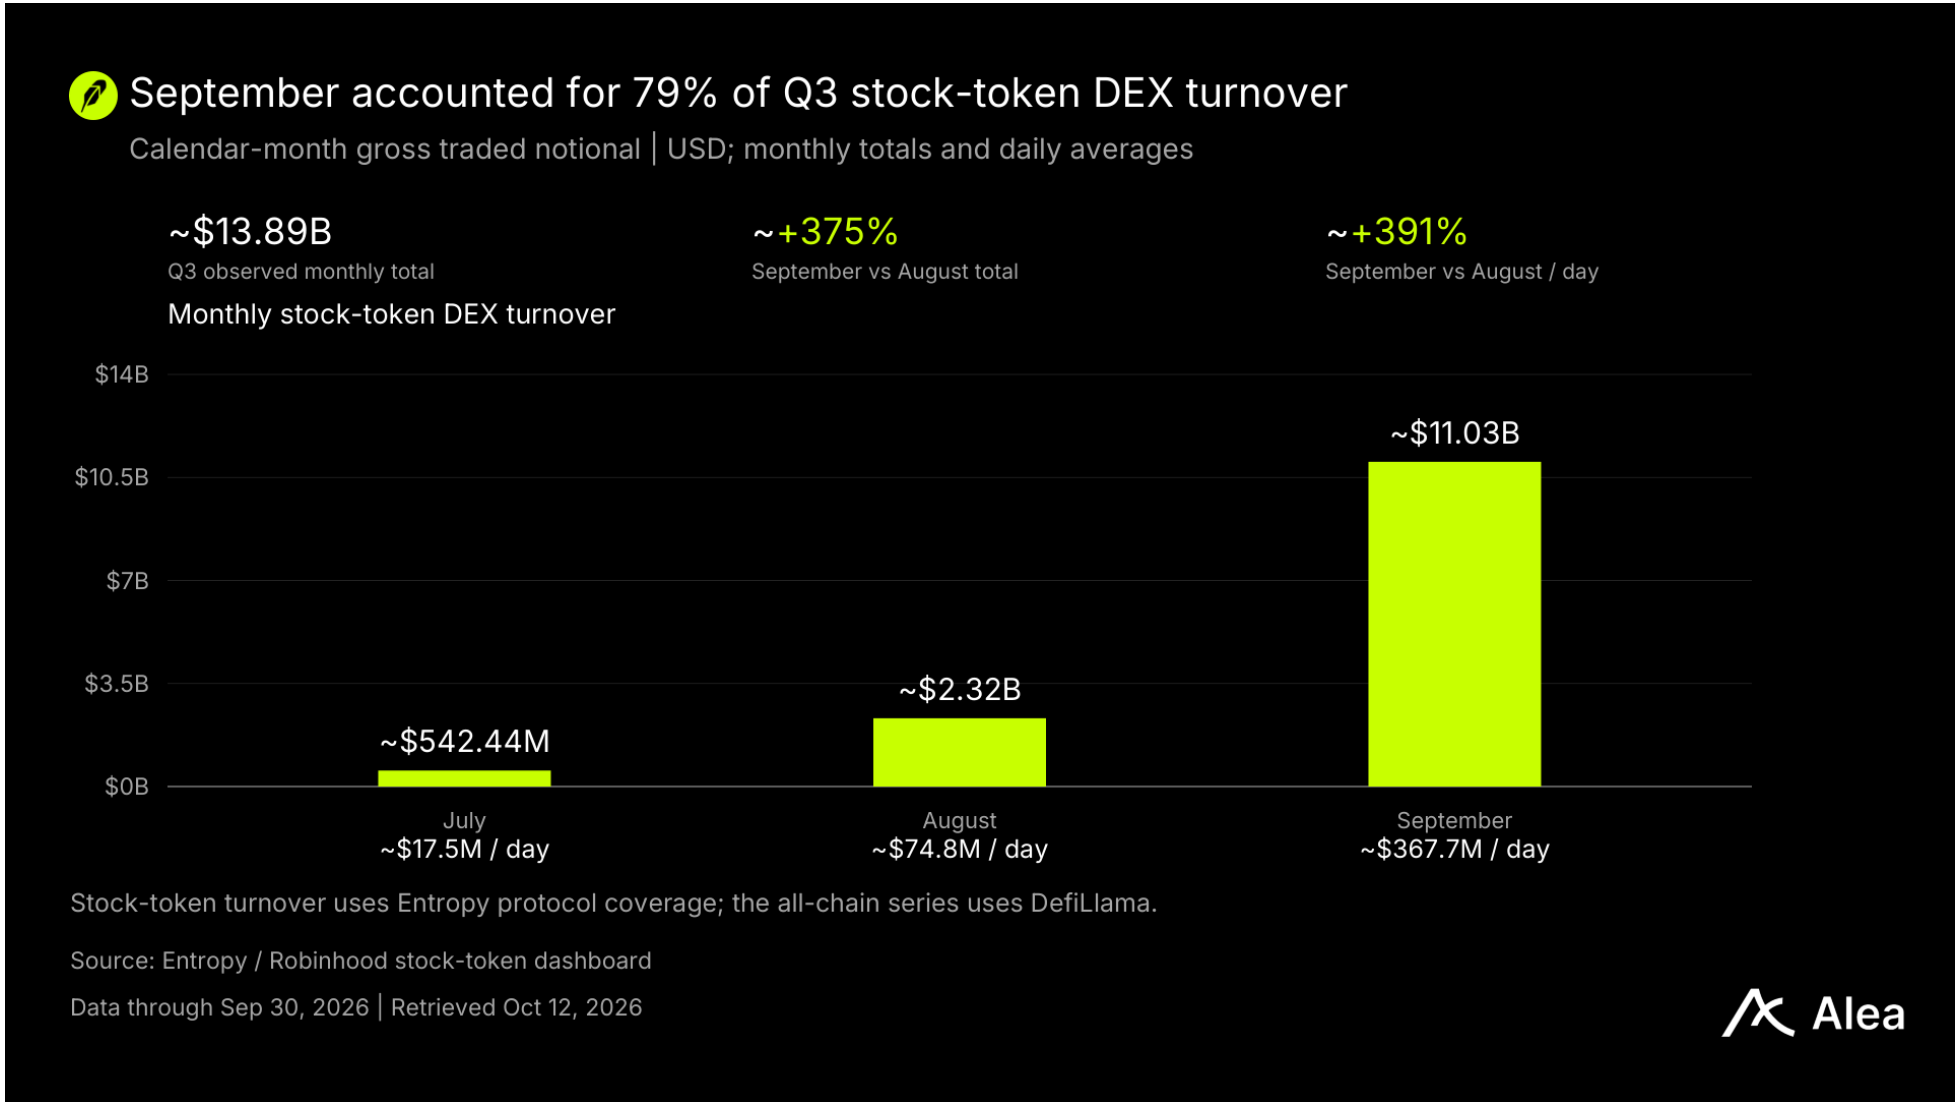

Figure 12. Monthly stock-token DEX turnover, daily averages and September growth.

Secondary turnover grew faster than month-end token value. Tokens can trade repeatedly, allowing traded notional to expand faster than the outstanding balance.

Net issuance reached **$24.33M** in July, **$35.47M** in August, and **$87.96M** in September. Quarterly mints were **$505.77M** and burns **$358.01M**, leaving **$147.76M** in net issuance.

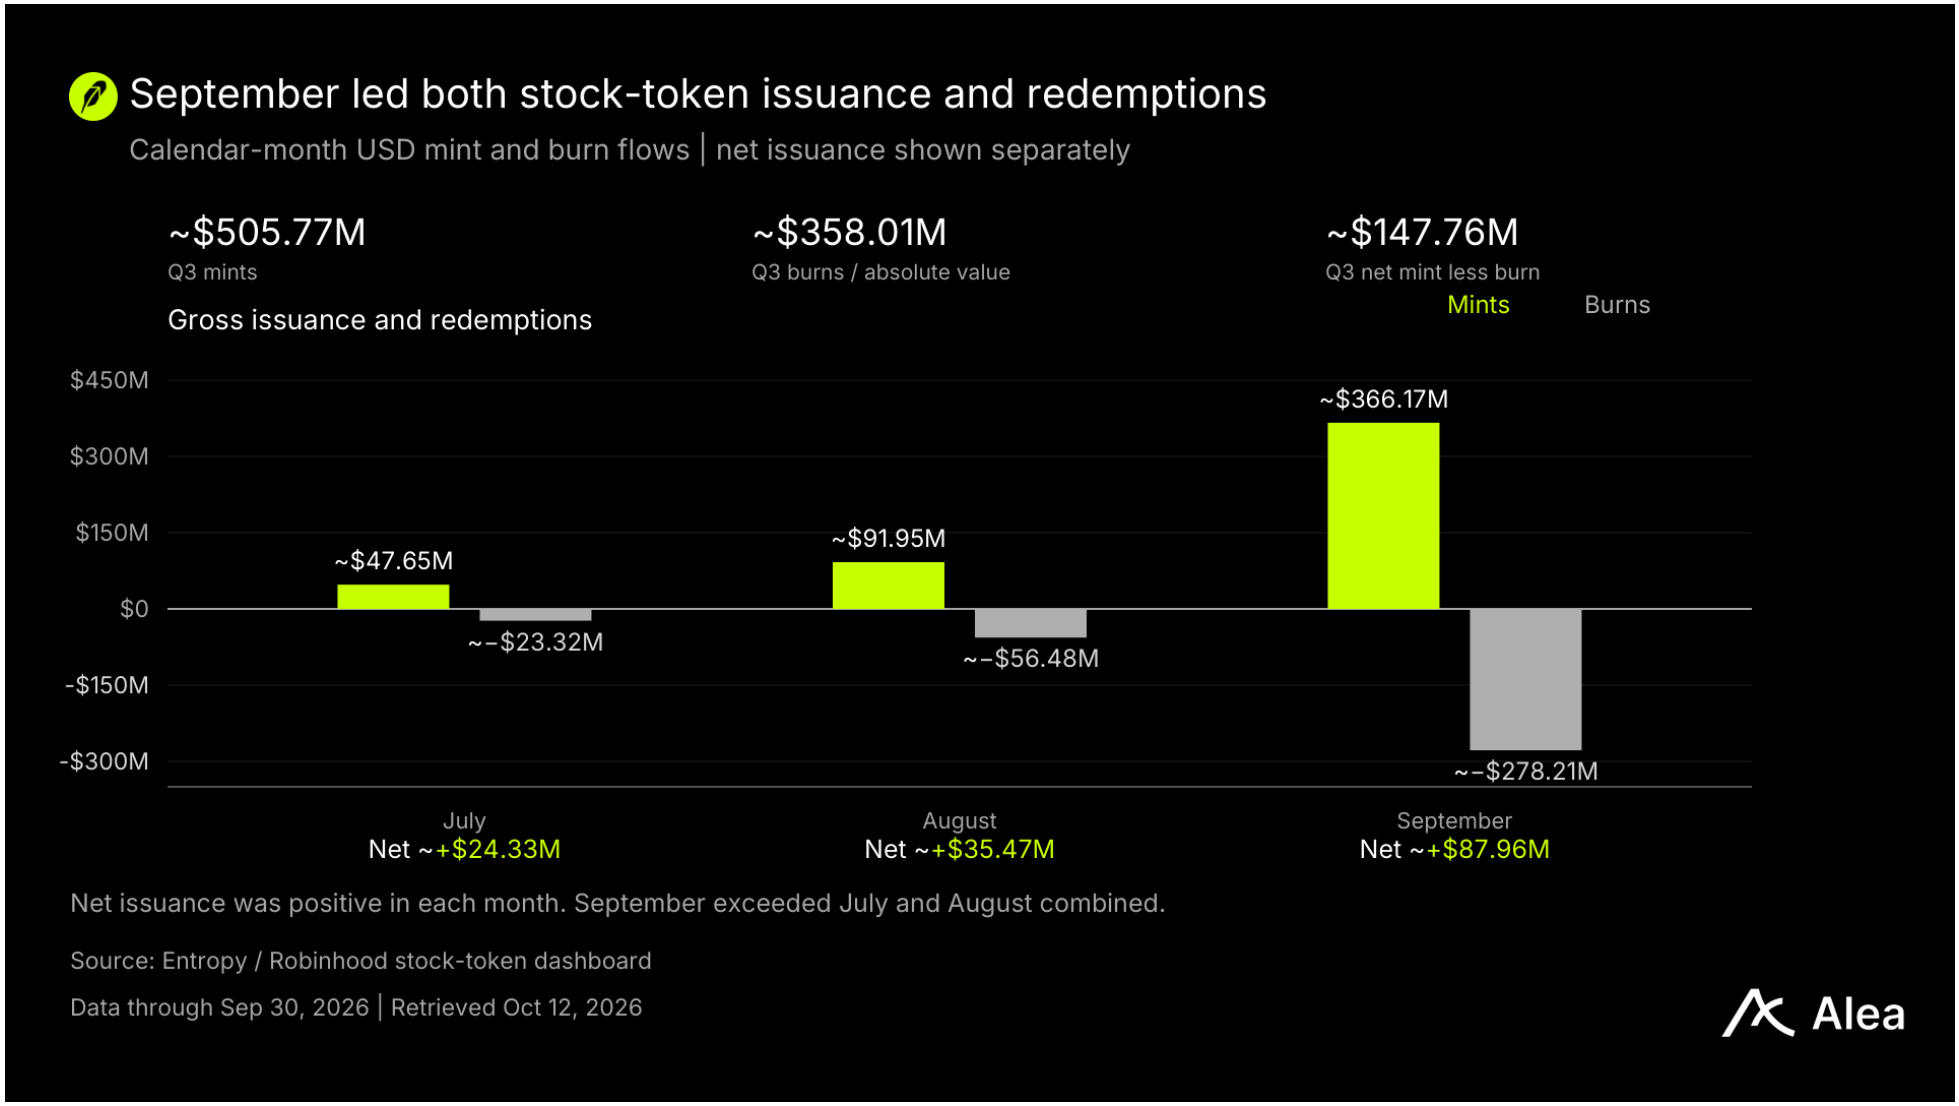

Figure 13. Monthly stock-token mints and burns, with net issuance shown separately.

Authorized participants minted more token value than they redeemed in every month. September net issuance exceeded July and August combined. Minting and redemptions change issued balances; DEX turnover measures trading of existing tokens.

Addresses holding stock-token balances above $1 rose from **27.42K** at July-end to **83.83K** at August-end and **200.4K** at September-end.

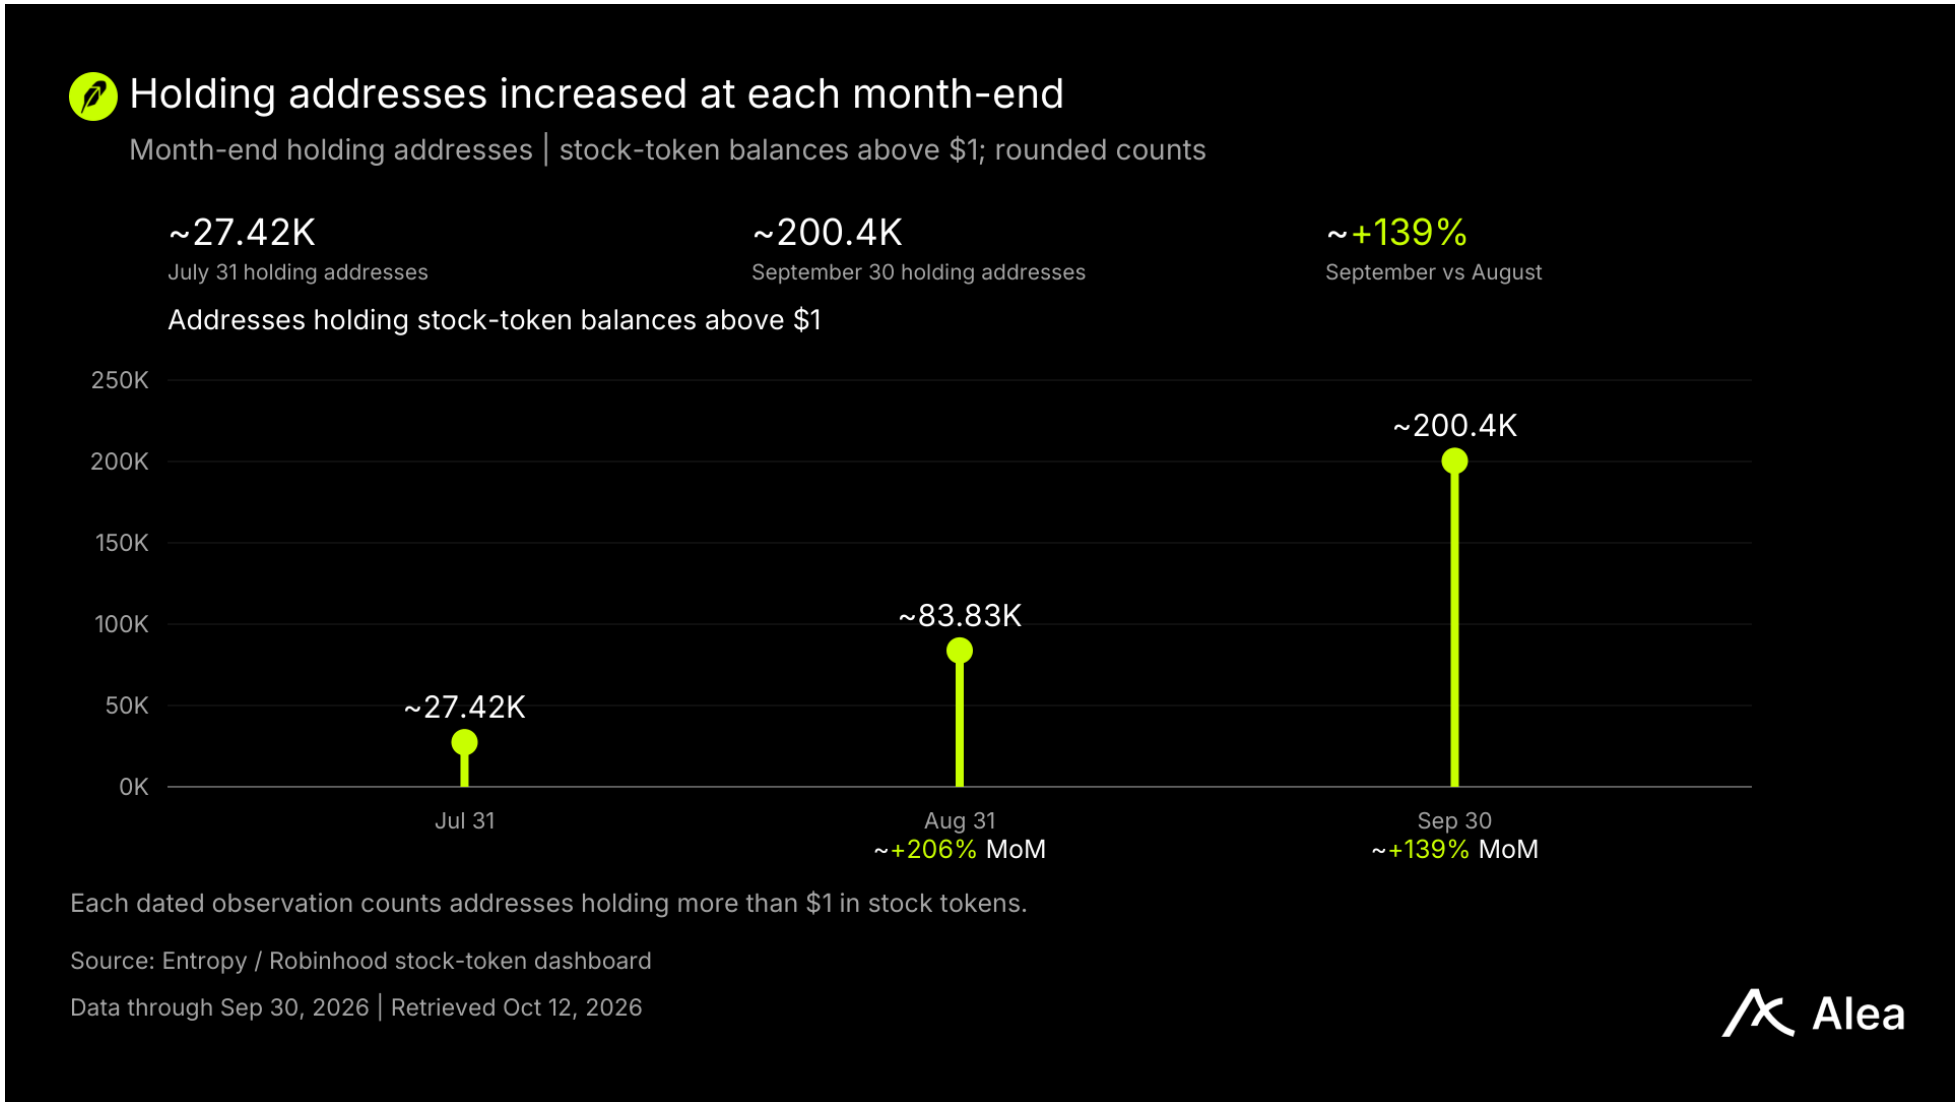

Figure 14. Month-end addresses holding stock-token balances above $1.

Qualifying balances spread across more addresses each month. These are address counts: one holder can use several addresses, while a custodian can aggregate multiple holders.

Trading and Lending

July spot turnover was **$15.31B**. August grew **26.50%** to **$19.37B**; September reached **$55.99B**, or **61.75%** of Q3 turnover. September averaged **$1.87B** per day against August's **$624.76M**.

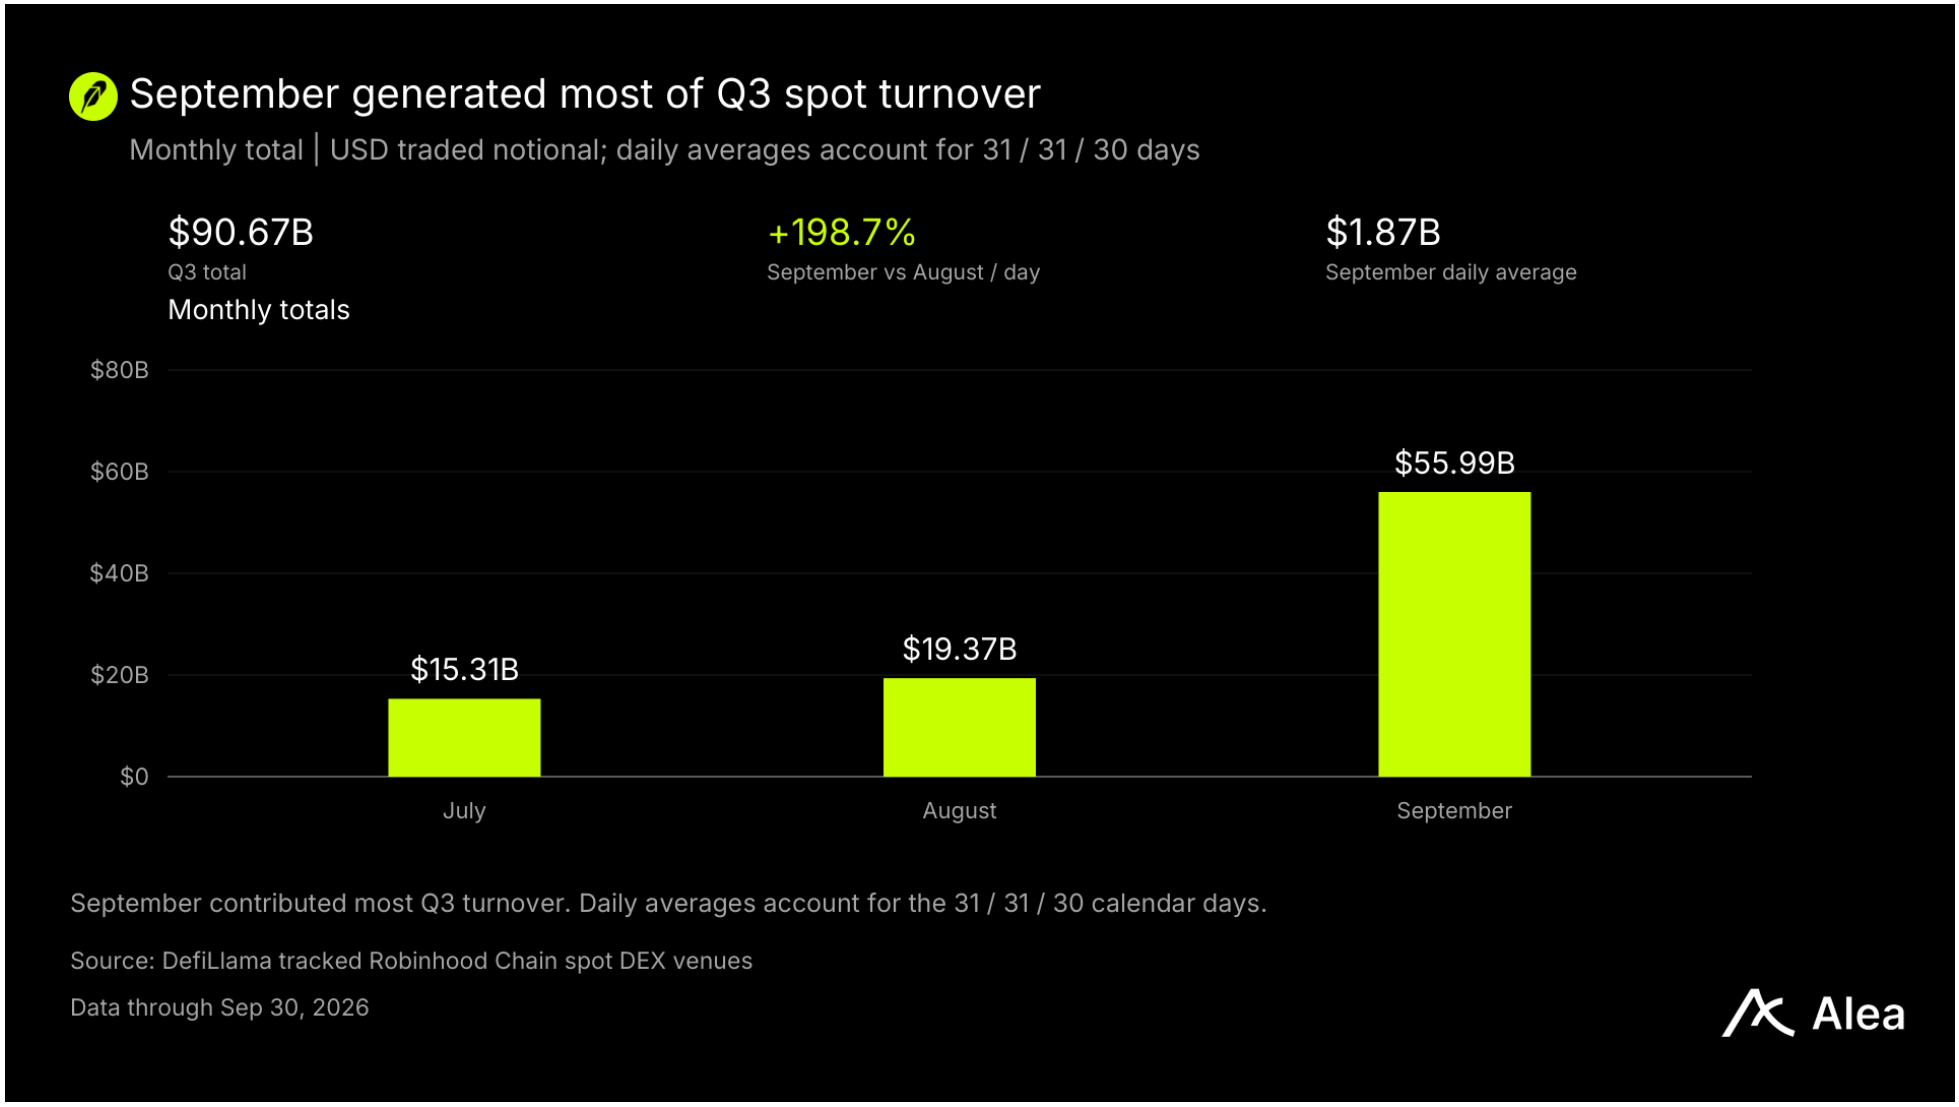

Figure 15. Monthly spot DEX turnover with daily-average and MoM context.

September's daily trading rate nearly tripled August's.

Spot trading accelerated around the fee peak. September 11 to 30 averaged **$1.58B** per day against **$522.82M** during the 60 days before August 30.

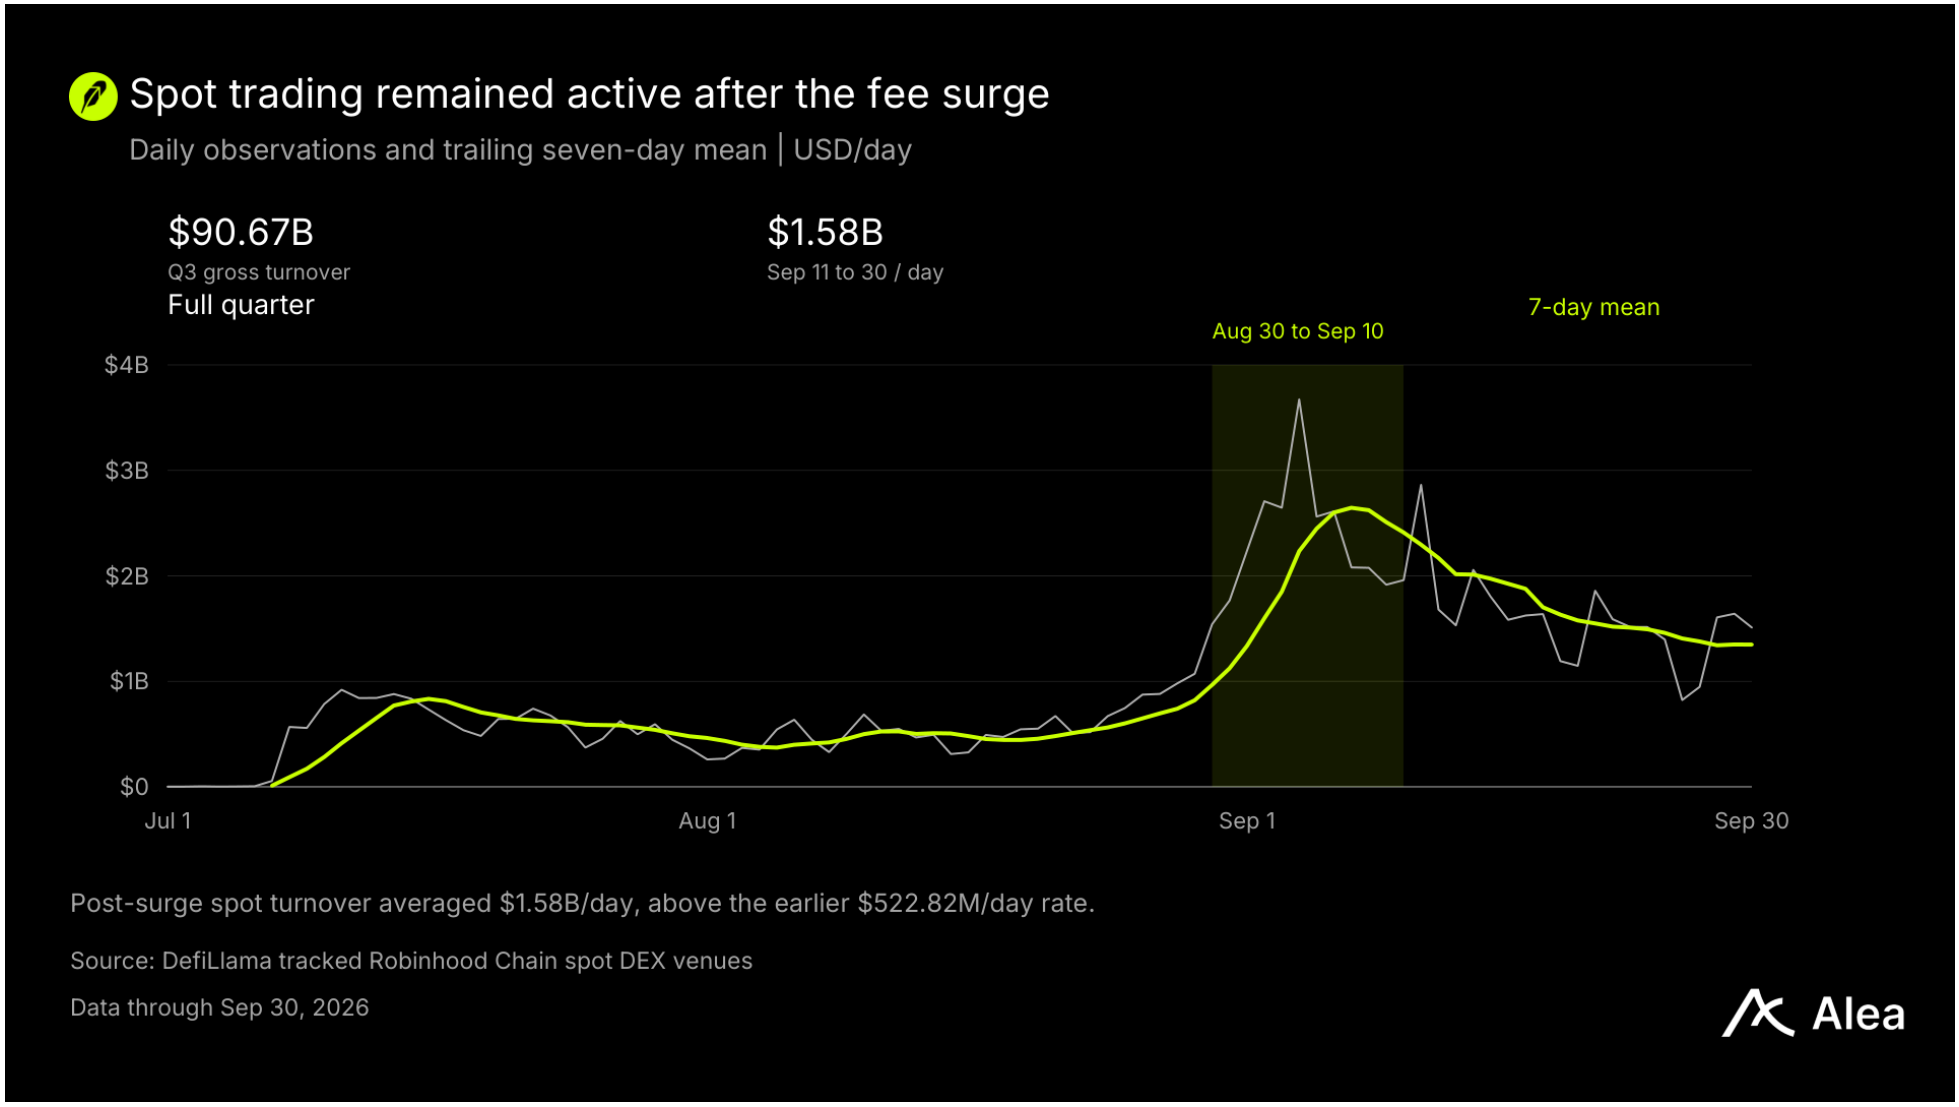

Figure 16. Daily spot trading with a seven-day mean and the fixed network-fee surge interval.

Relative to the surge average, post-surge spot turnover fell less sharply than network fees.

The three largest Uniswap deployments handled **84.59%** of Q3 spot turnover. V3's share was highest in July; V4 gained share later.

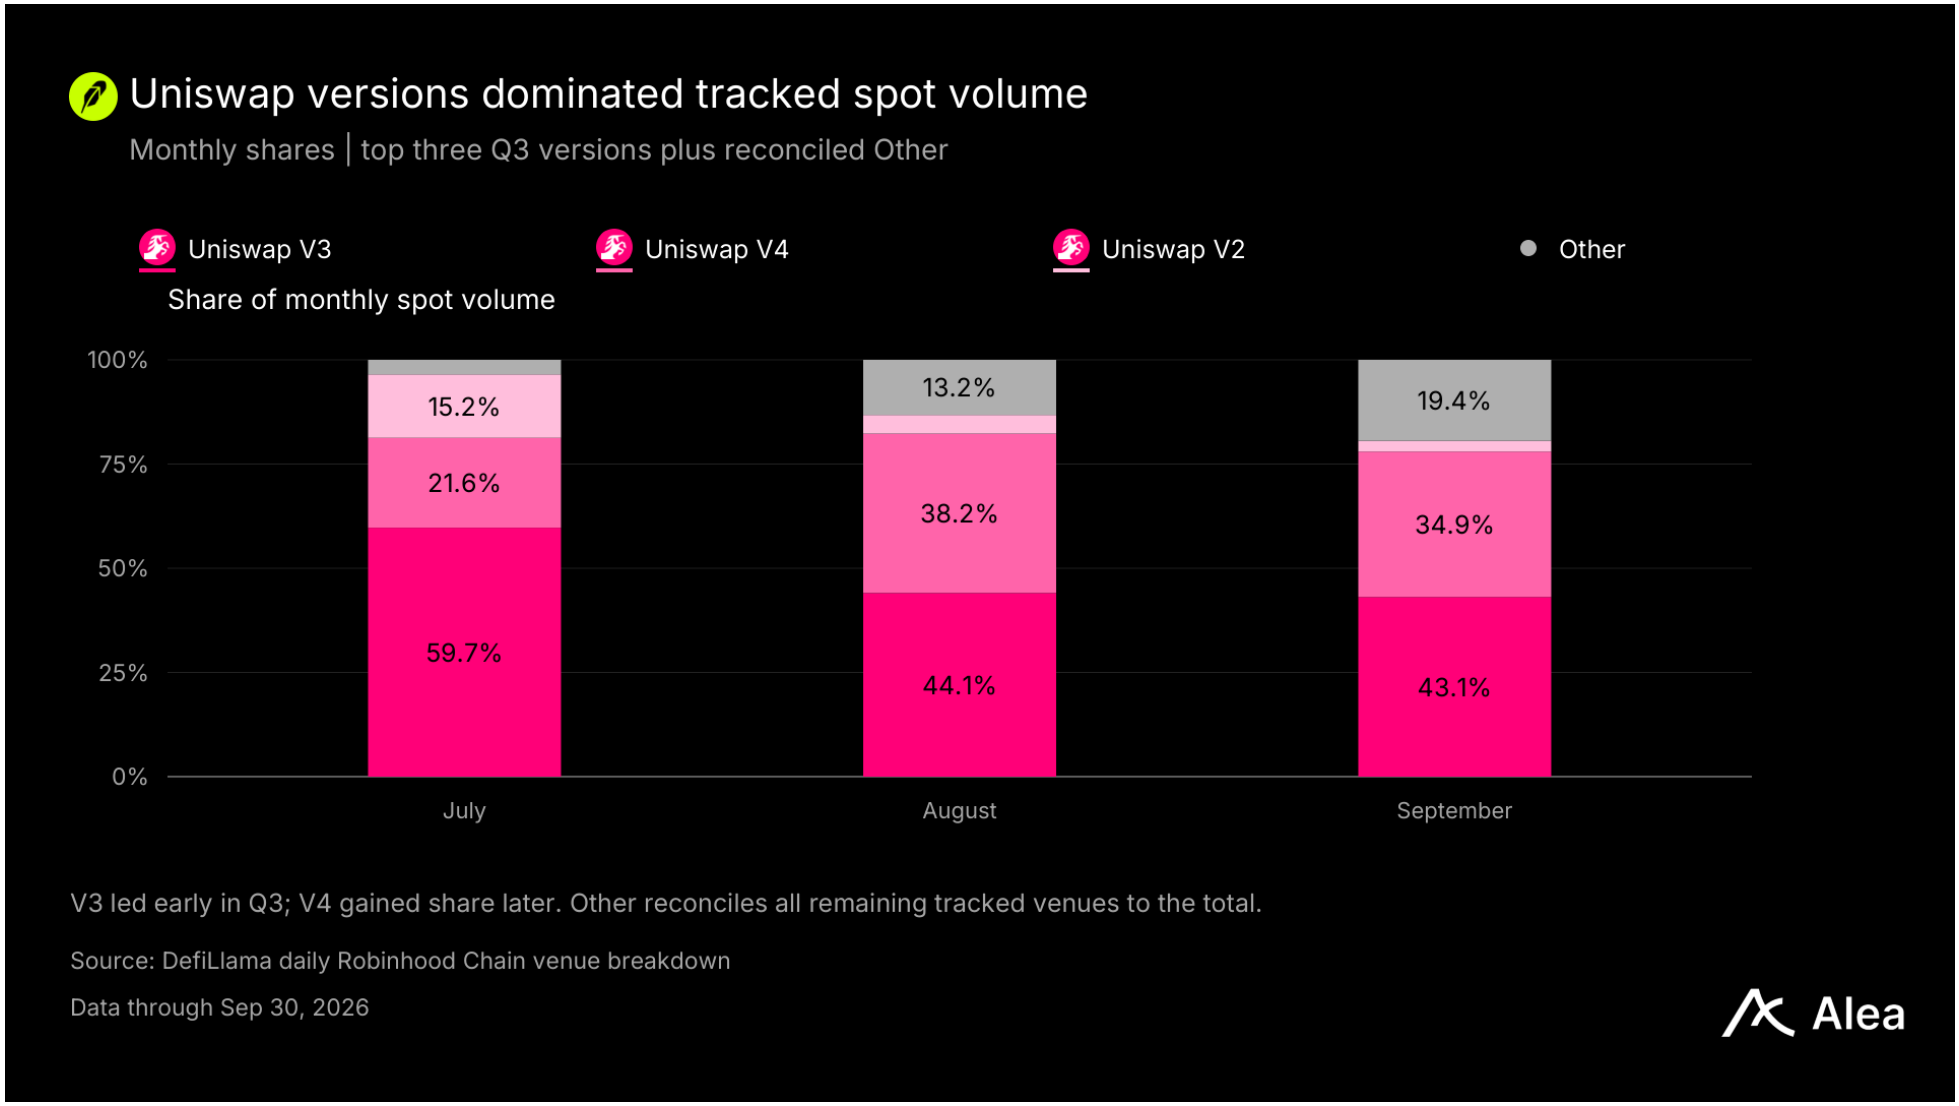

Figure 17. Monthly spot-volume shares for the three largest Uniswap versions and all other tracked venues.

V3 remained the largest deployment each month, while V4 finished with a higher share than in July.

V3 handled **$41.81B**, V4 **$30.23B**, and V2 **$4.66B** in Q3. Pons V2 and Ramses CL V2 followed in the deployment ranking.

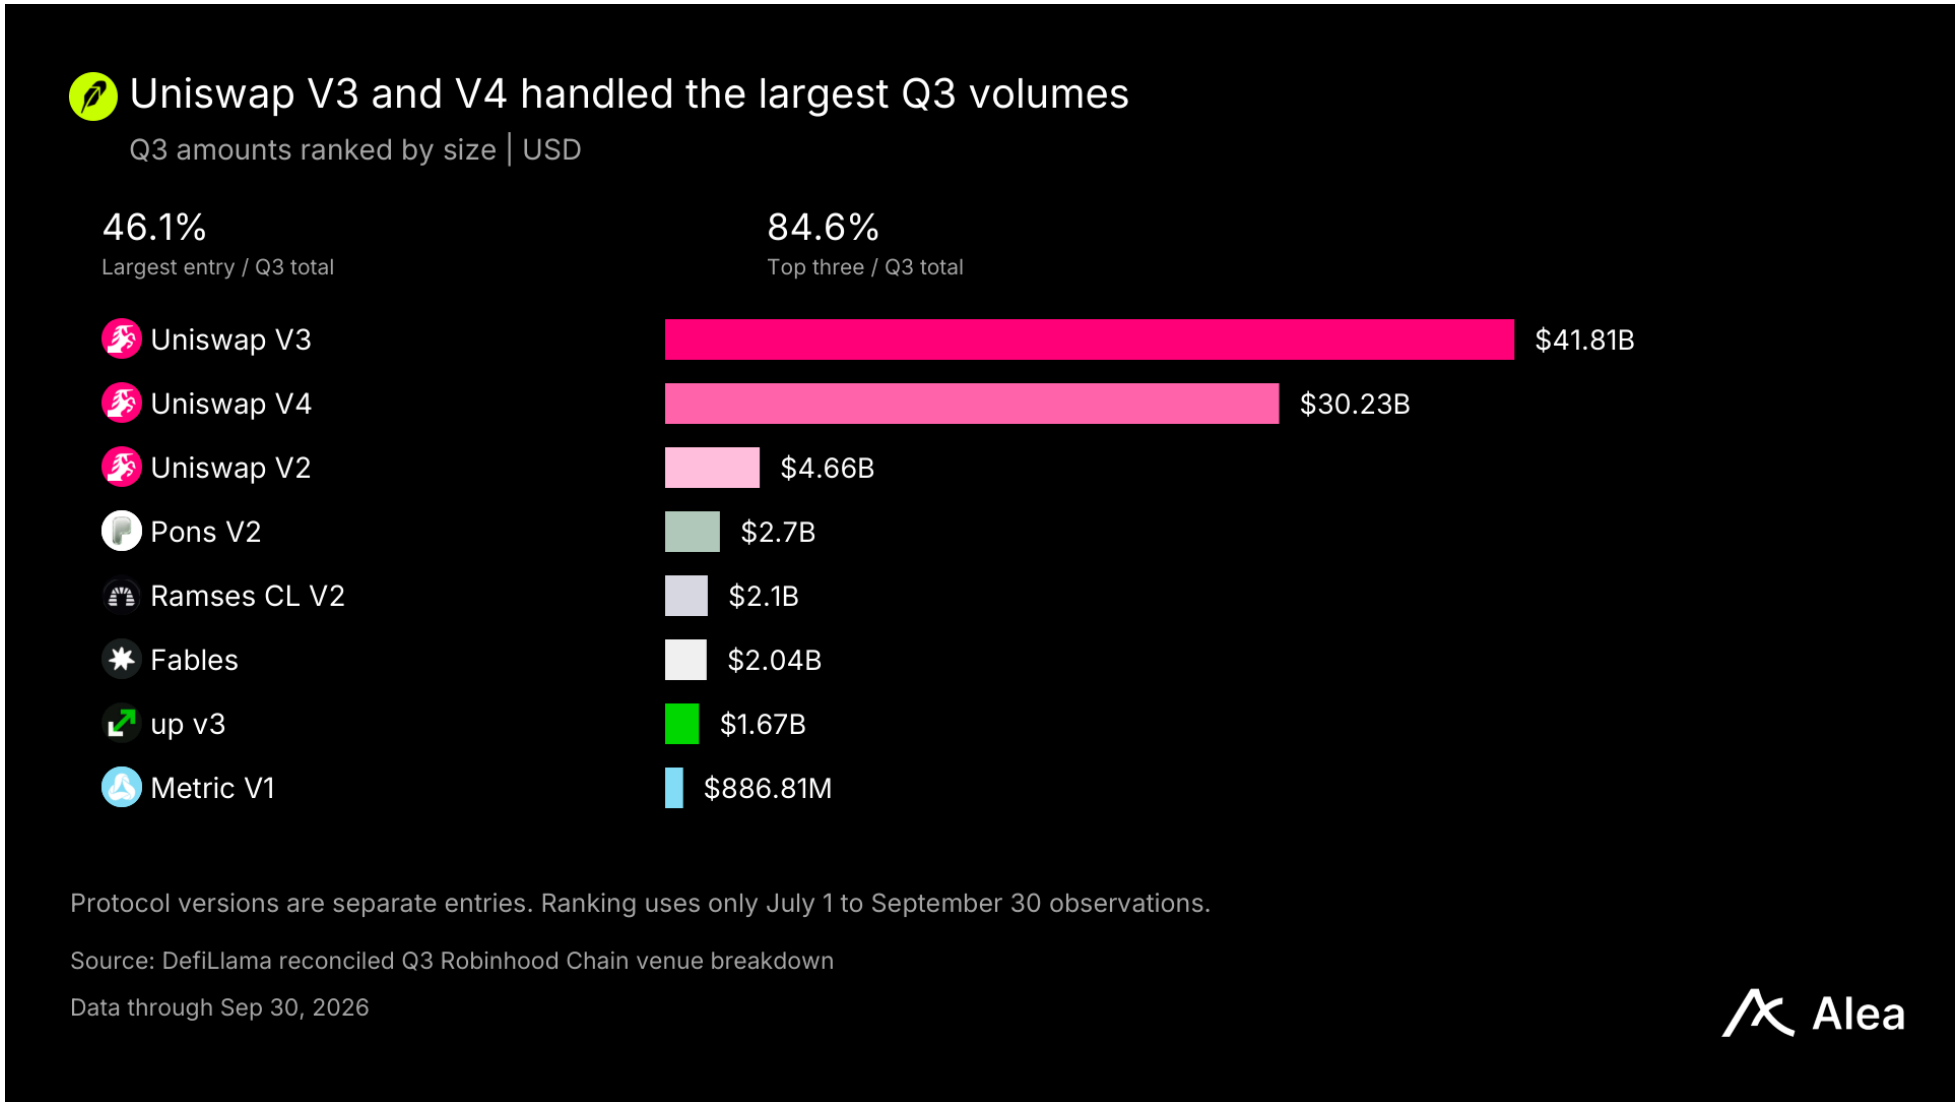

Figure 18. Ranked Q3 trading volume by named exchange version.

Uniswap occupied the three largest entries. The deployment ranking separates versions of the same protocol; consolidating them would increase Uniswap's lead.

Monthly spot turnover divided by average chain TVL was **82.58x** in July, **36.47x** in August, and **60.07x** in September. The denominator covers all DeFi protocols, including lending.

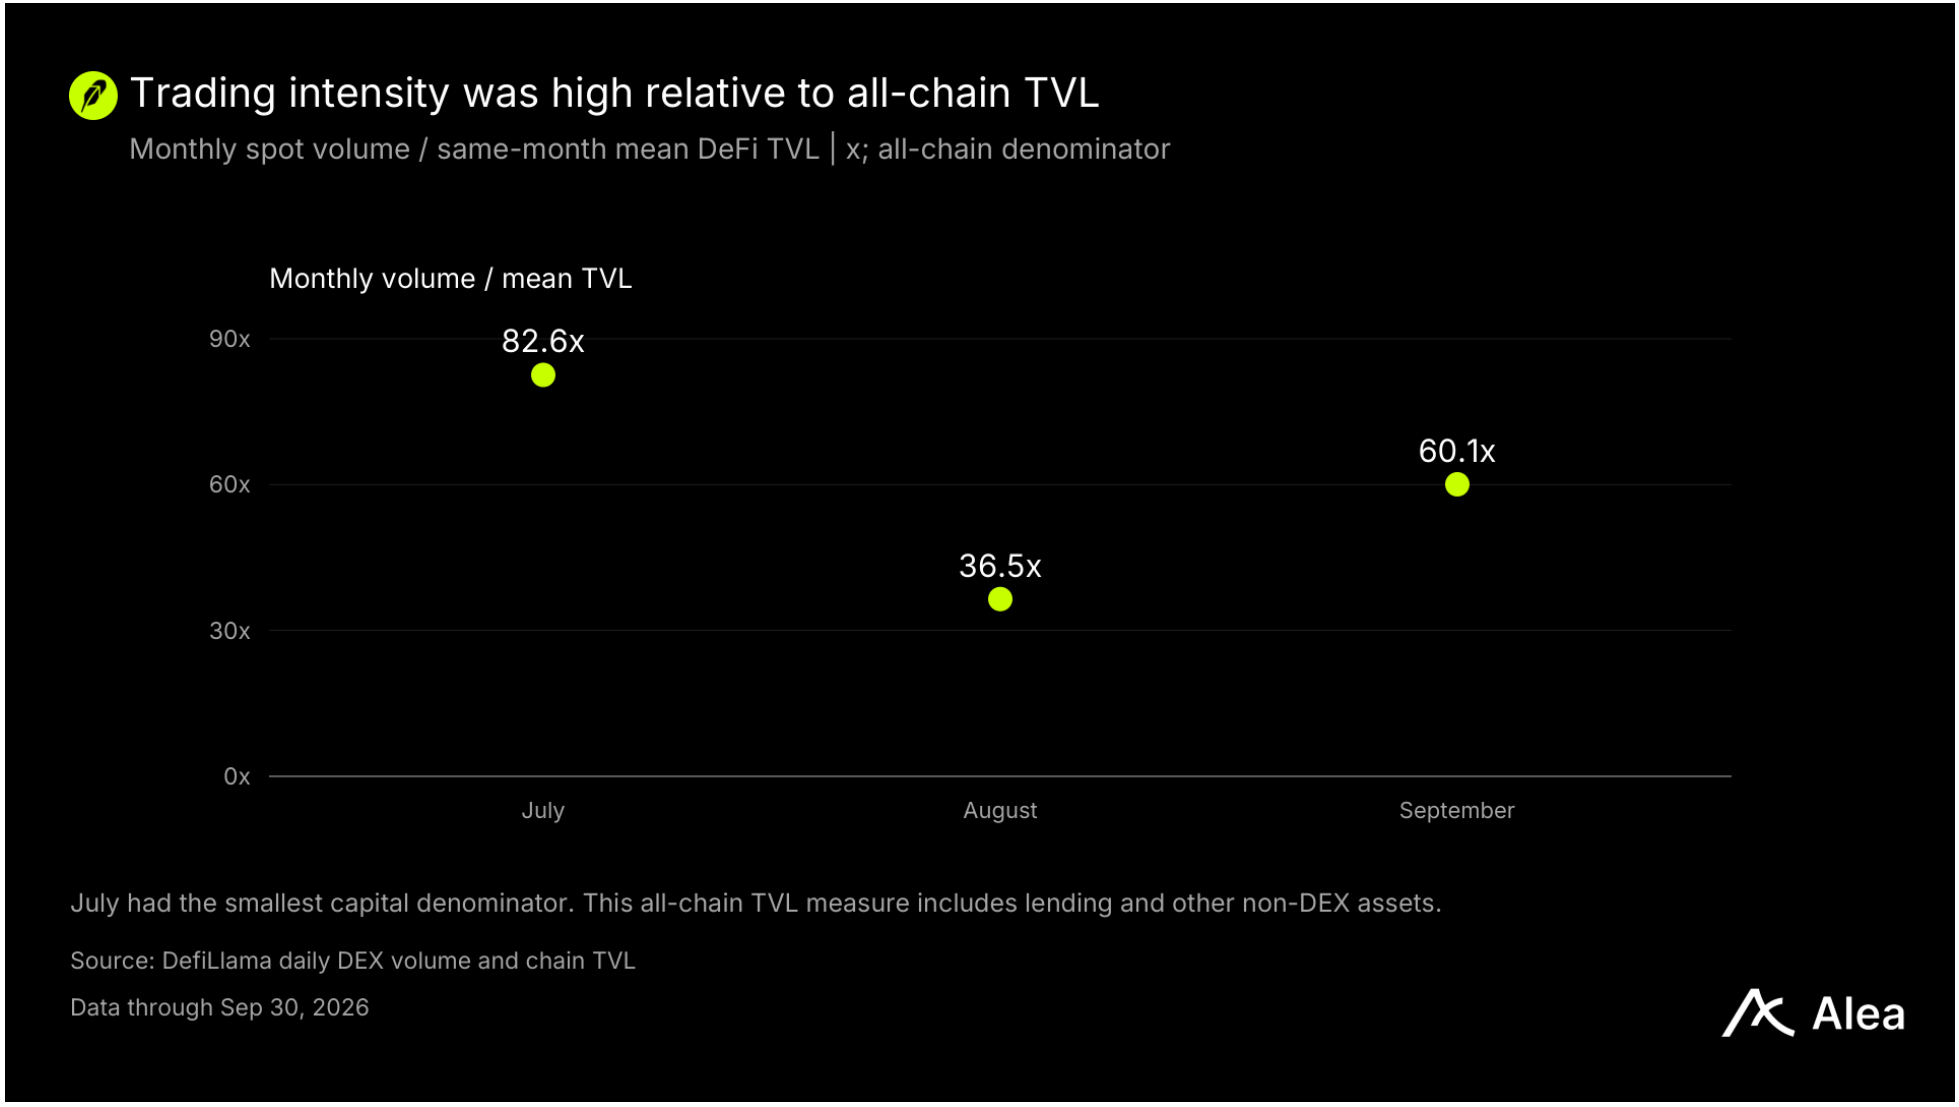

Figure 19. Monthly spot-volume-to-average-chain-TVL ratios.

July's small average capital base produced the highest turnover ratio. Capital grew faster than trading in August; trading grew faster than capital in September.

Outstanding borrowing on Morpho Blue rose from **$235.56M** at July-end to **$414.98M** at August-end and **$456.07M** at September-end. Its chain TVL reached **$568.17M**.

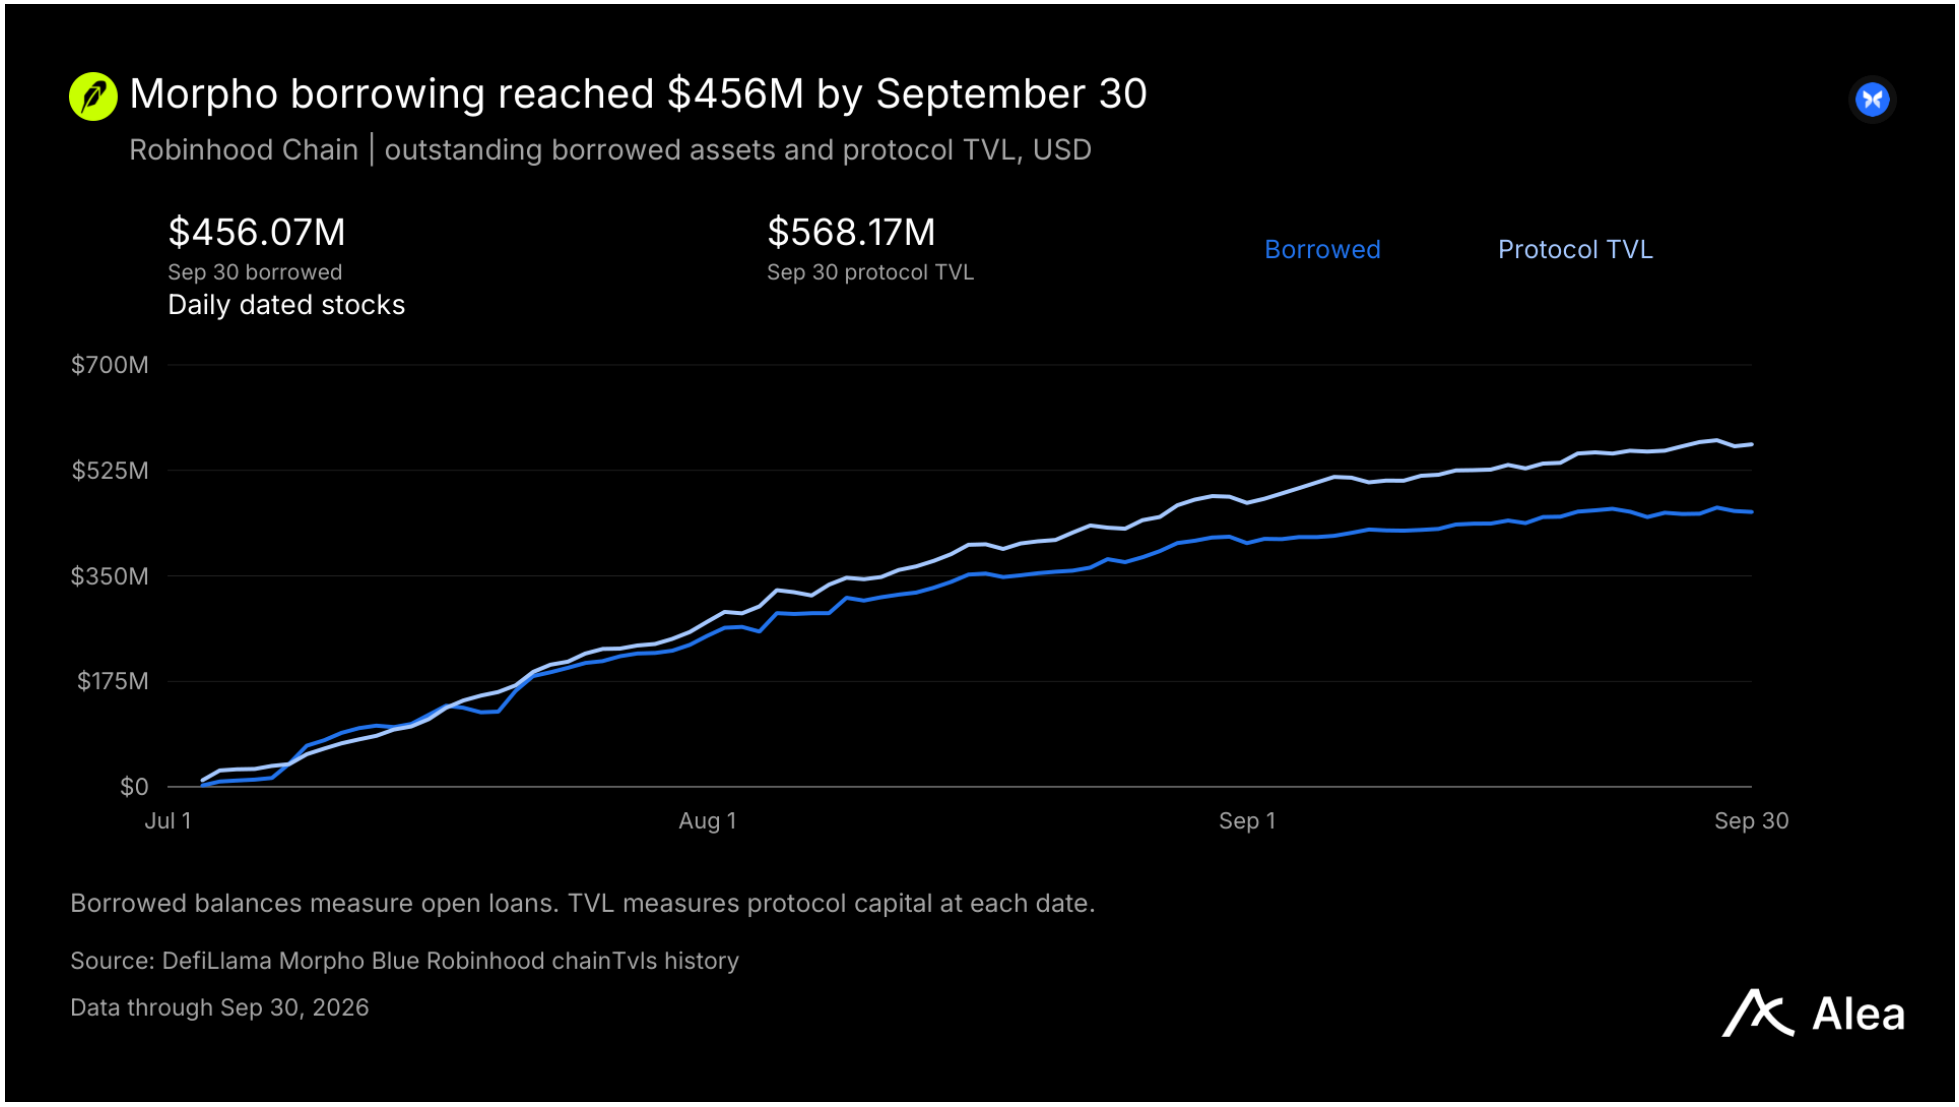

Figure 20. Daily Morpho borrowed balances and protocol TVL on Robinhood Chain.

Outstanding borrowing increased each month alongside Morpho's capital base. It measures loans still open at each date, separate from the value of new loans originated.

Execution and Costs

September averaged **9.49M** transactions per day, **55.85%** above July's **6.09M**. The final 20 days averaged **8.70M**. August 12 recorded the quarter's **26.05M** peak day.

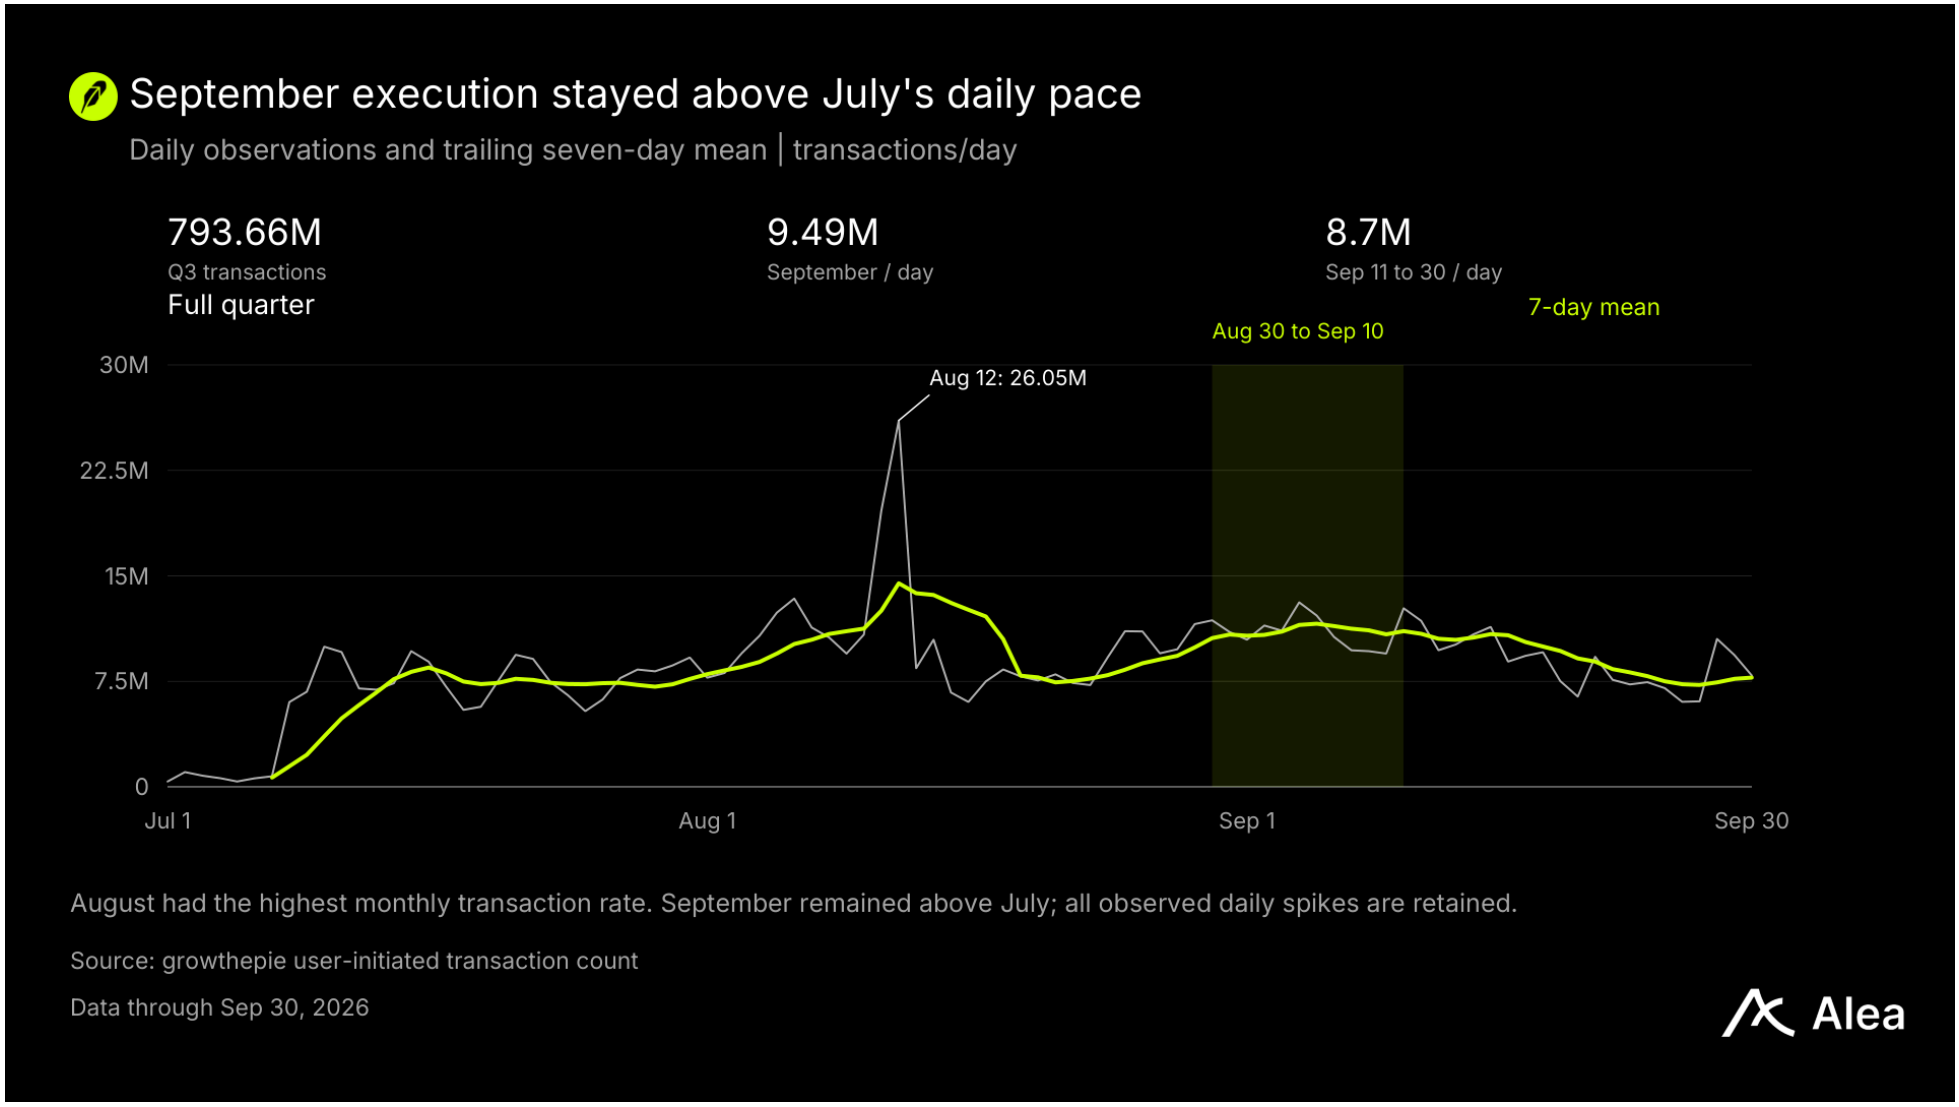

Figure 21. Daily user-initiated transactions and their trailing seven-day mean.

Execution peaked in August, then slowed in September while remaining above July's daily pace.

Daily active sender addresses averaged **402.74K** in Q3. August 12 reached **5.18M**; excluding that day lowers the mean to **350.20K**.

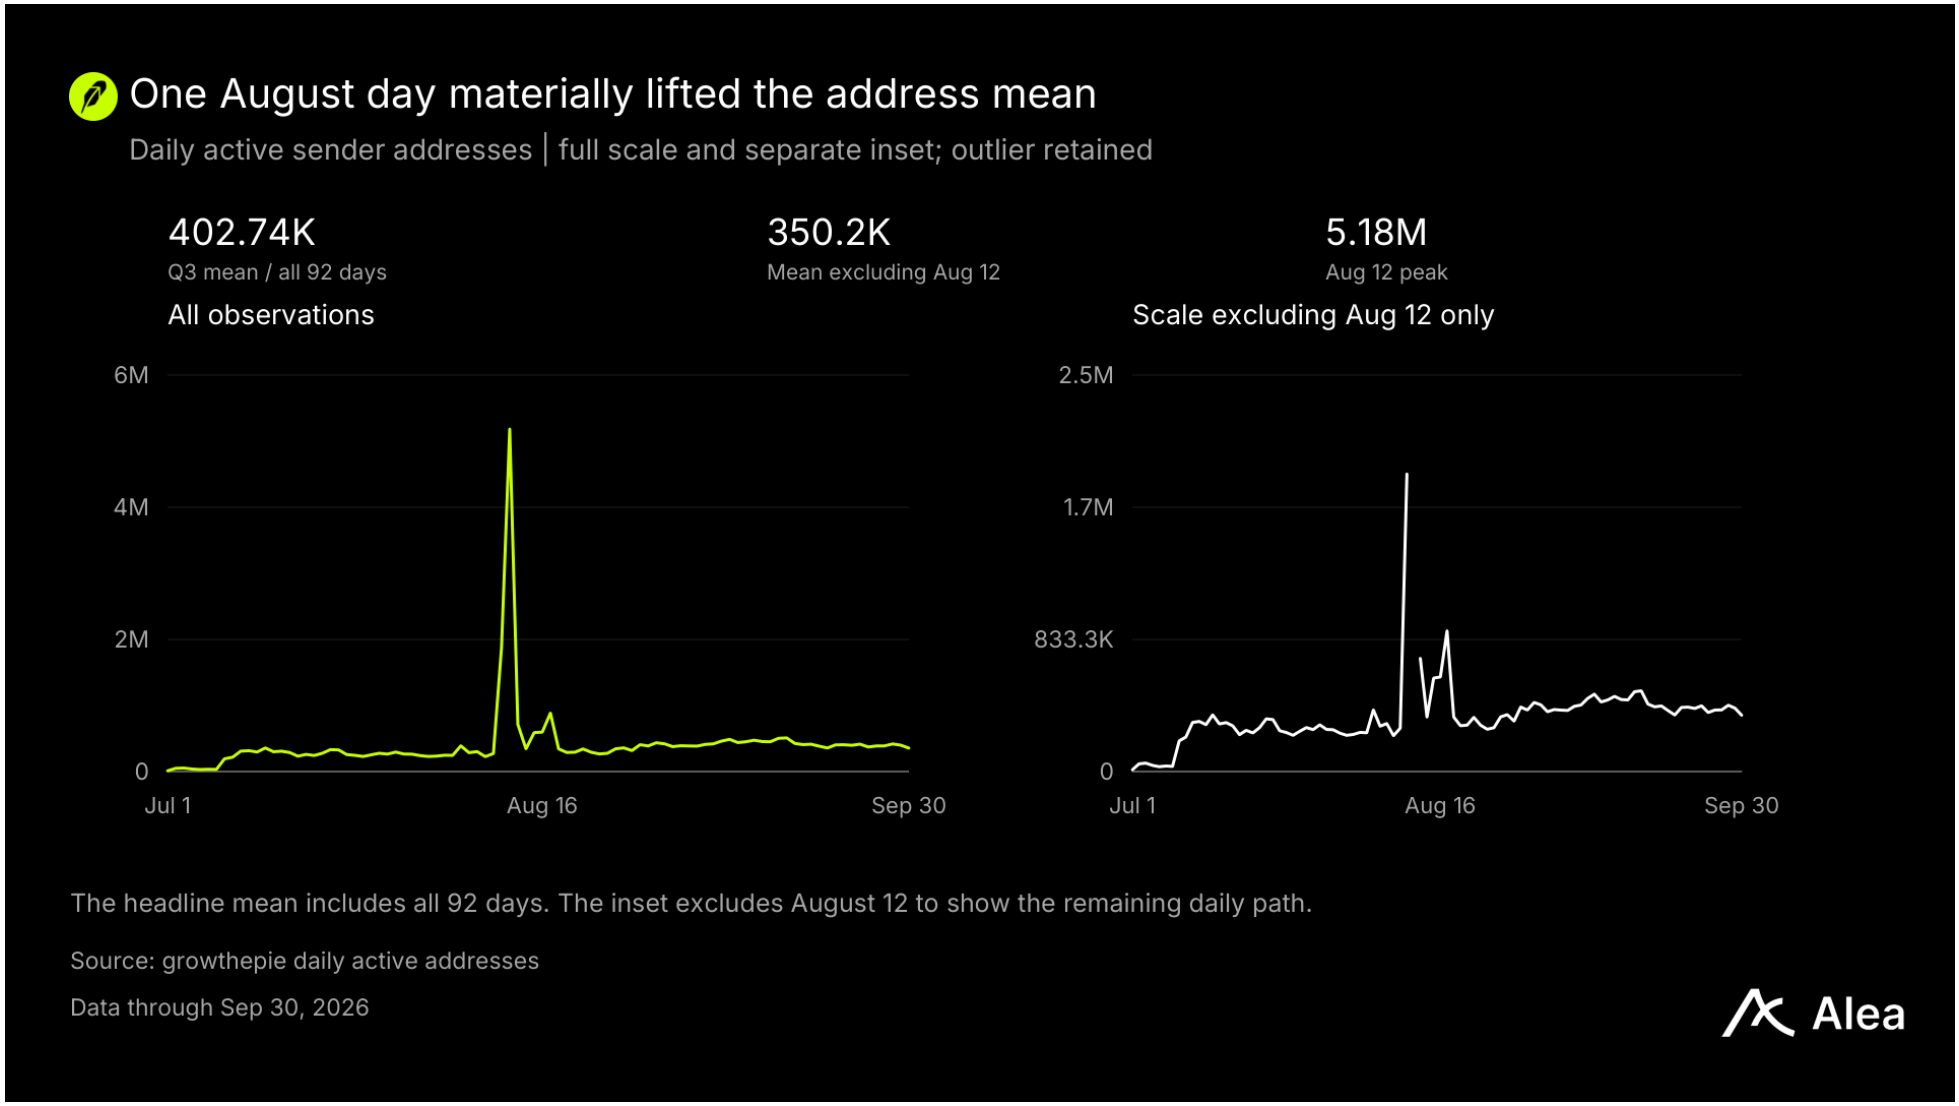

Figure 22. Full-scale daily active addresses and a separate zoom omitting only August 12.

One day lifted both the August and Q3 averages. The full-quarter mean includes it. Each daily count measures distinct sender addresses for that day.

Mean compute throughput, measured in millions of gas per second, rose from **12 Mgas/s** in July to **19.25 Mgas/s** in August and **25.58 Mgas/s** in September. September throughput increased **32.88%** as daily transactions fell **8.19%**.

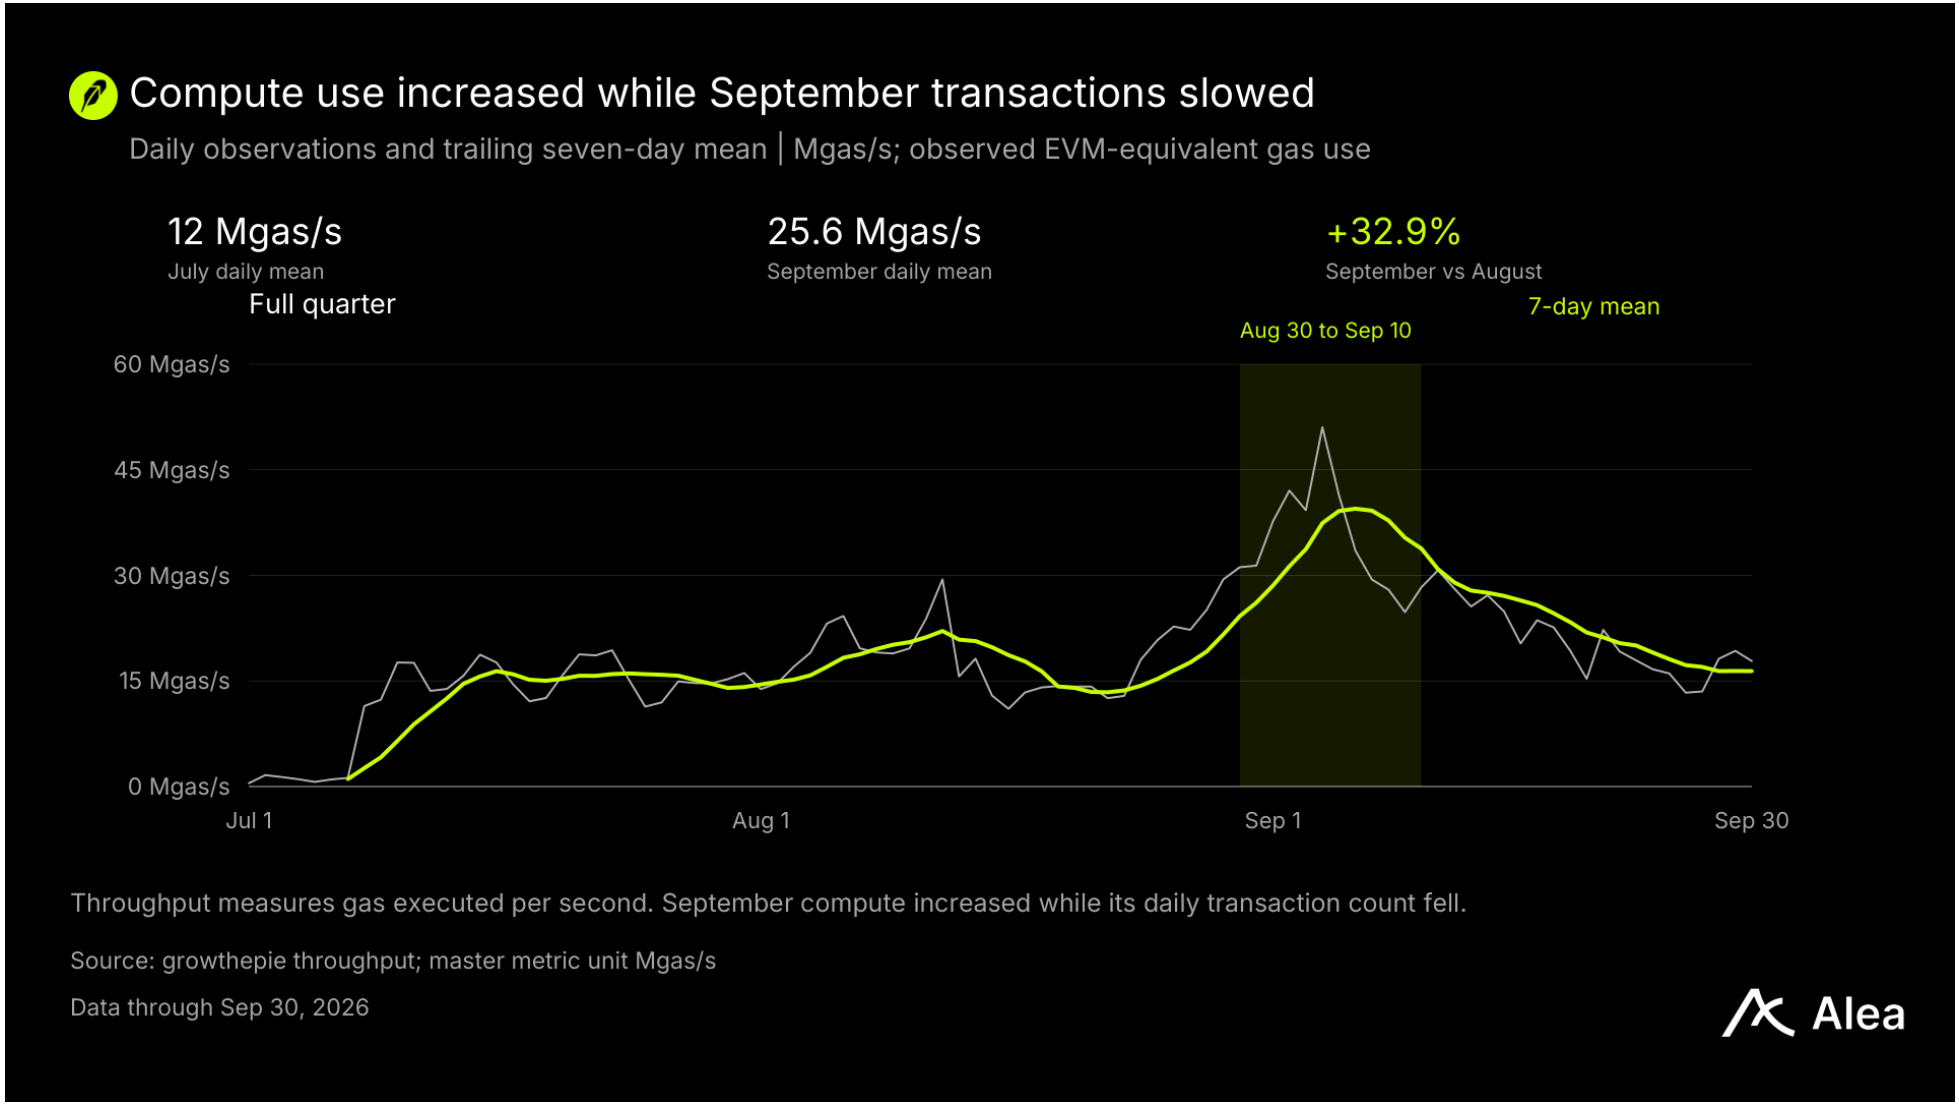

Figure 23. Daily compute throughput in Mgas/s and a trailing seven-day mean.

The chain executed more gas per second while processing fewer user-initiated transactions per day. Network charges combine gas used × gas price for execution with the cost of posting data to Ethereum. Transaction counts measure executions; throughput measures the work performed.

The mean of daily median transaction costs rose from **$0.0095** in July to **$0.01** in August and **$0.0577** in September. The peak daily median was **$0.248** on September 4; the Q3 mean was **$0.0254**.

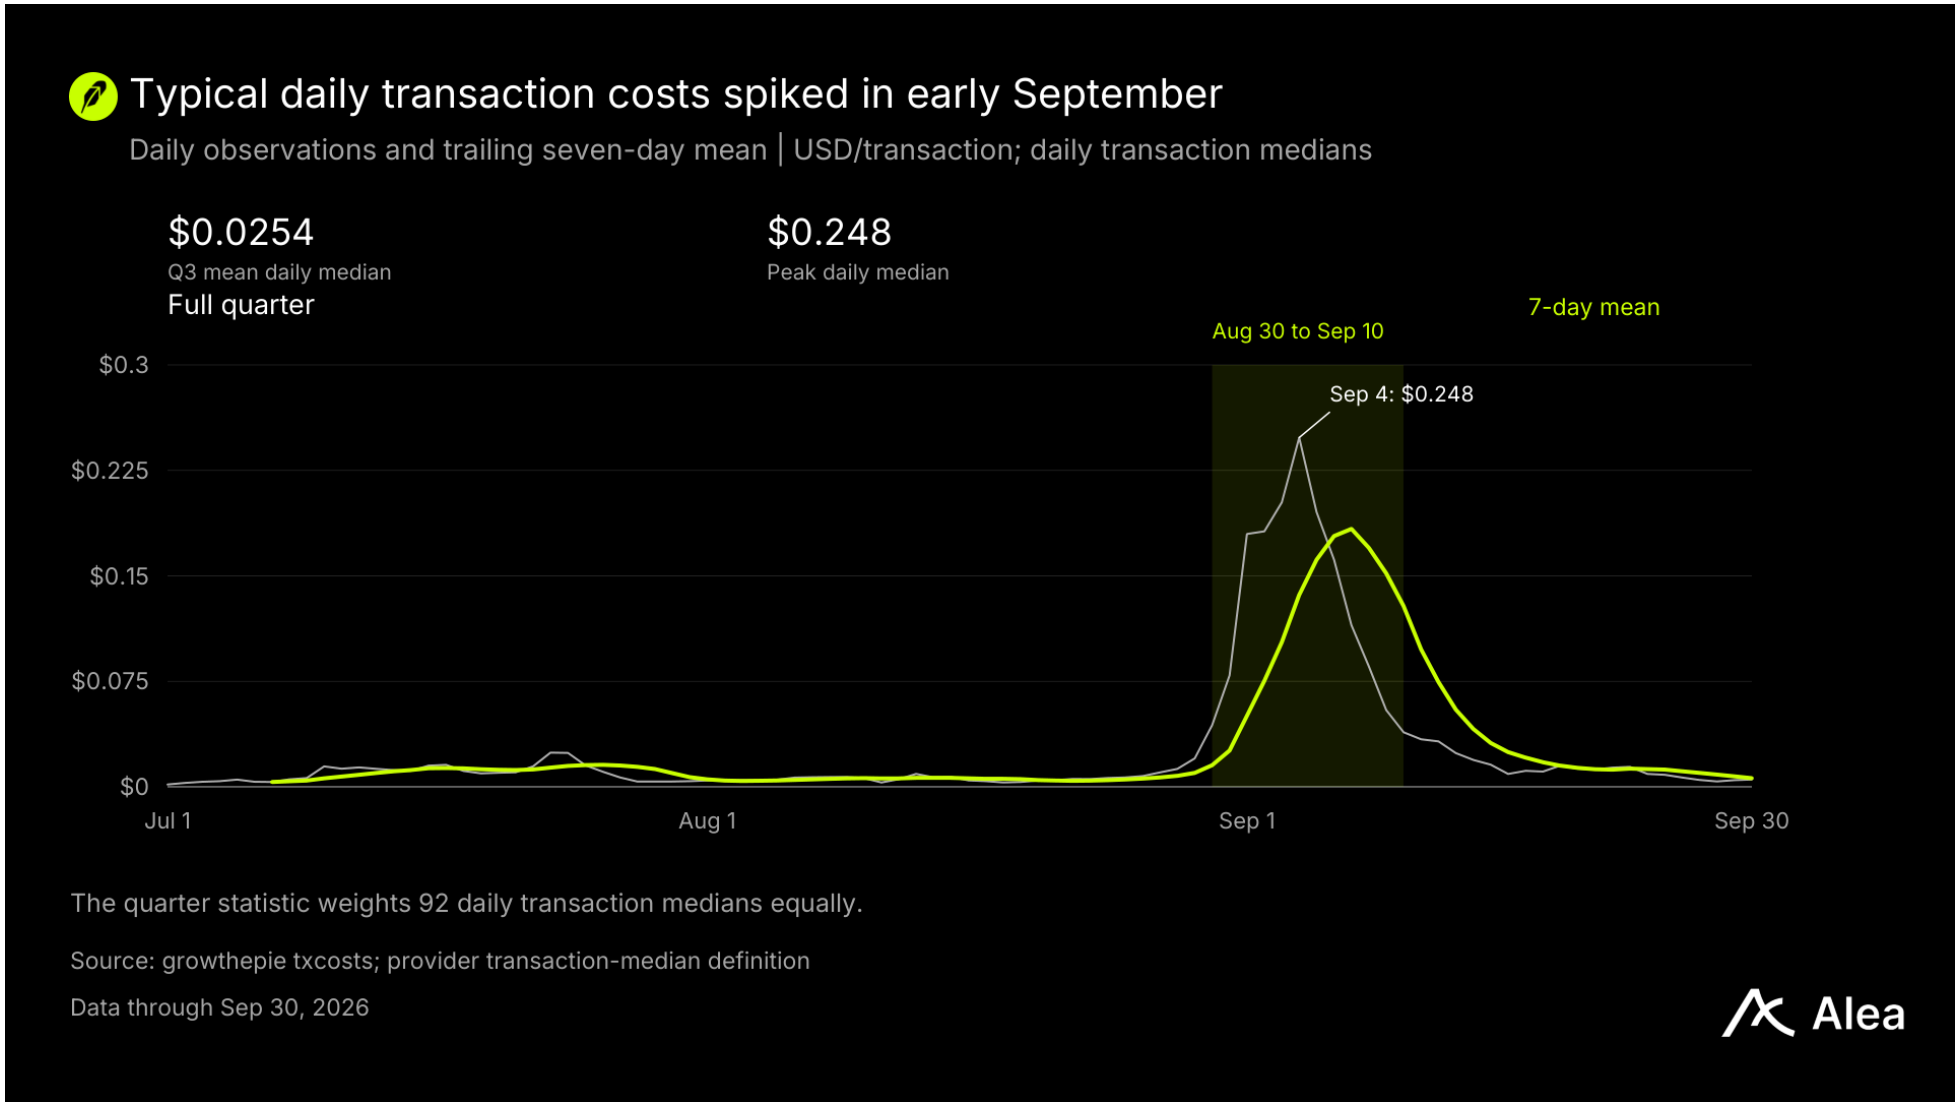

Figure 24. Daily median transaction costs with the fee-surge interval highlighted.

The early-September peak lifted the quarter's cost statistic. Later daily medians fell. The Q3 mean weights each daily median equally.

September had the widest spread in daily median costs. A small group of expensive days separated that month's mean from July and August.

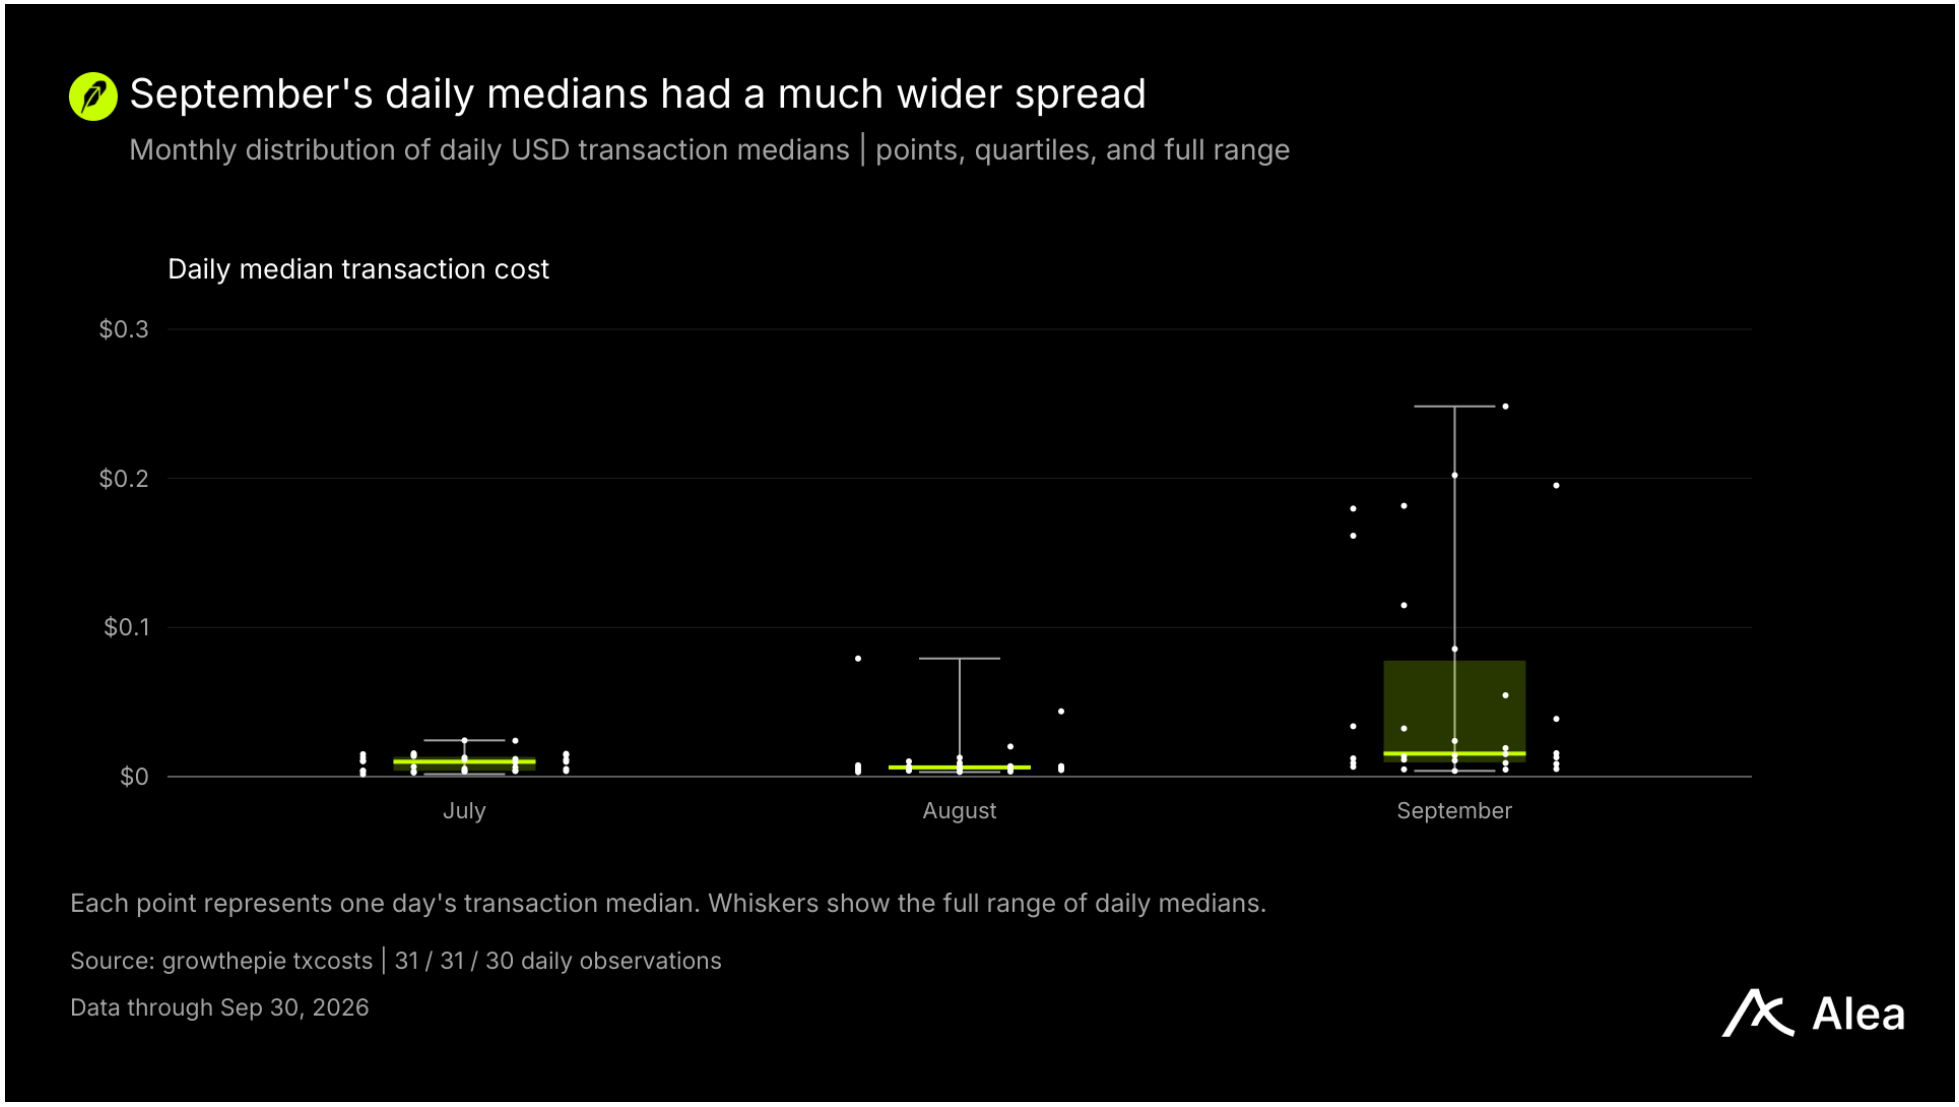

Figure 25. Monthly box plots display the spread of daily median transaction costs, with every daily point retained.

The full-range whiskers retain those expensive days. Each point is a daily median, with busy and quiet days carrying equal weight.

Uniswap received **115.82M** labeled Q3 transactions, StonkPit **29.01M**, and Relay **22.20M**. The top-40 application labels covered **44%** of network fees.

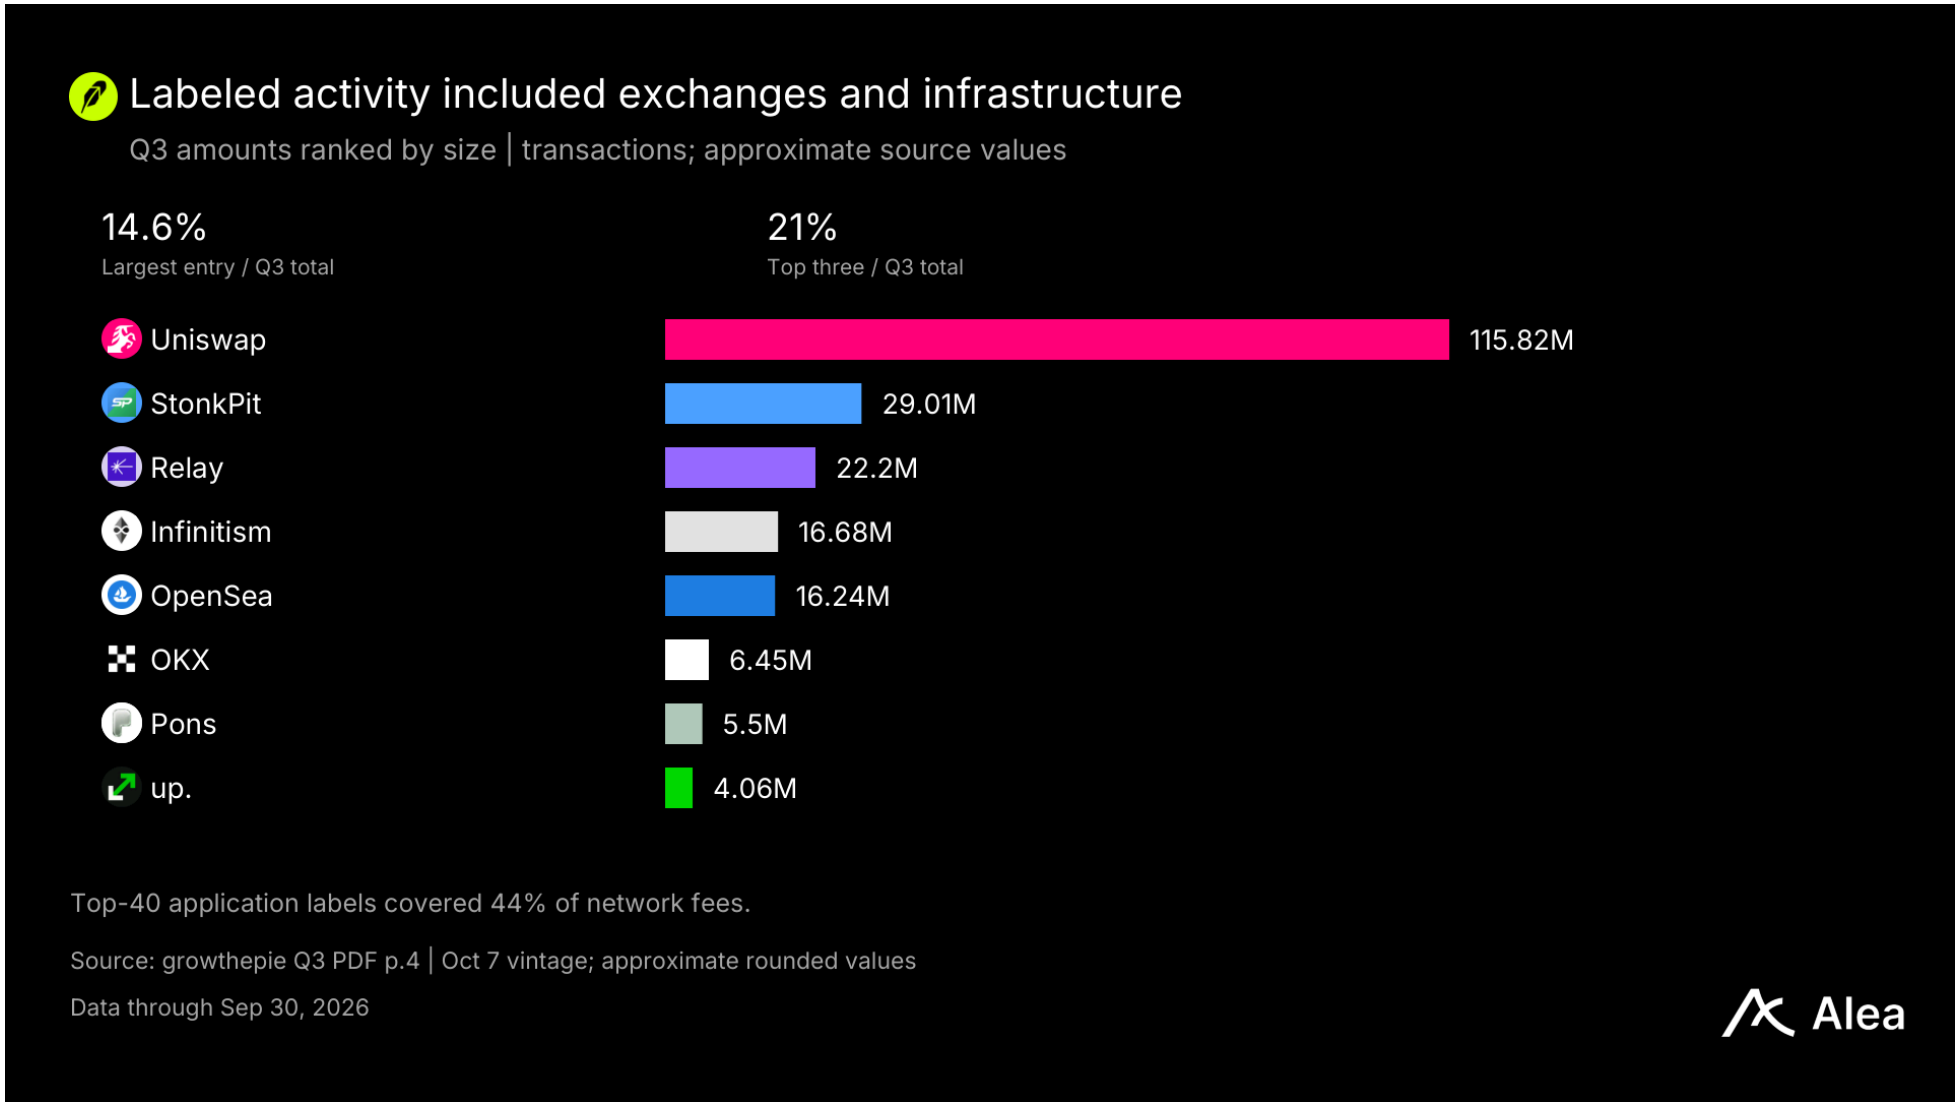

Figure 26. Rounded Q3 transaction counts for selected labeled applications.

Trading and gaming contributed application transactions. Bridges and account-abstraction infrastructure also appeared in the labeled activity.

Fees and Revenue

Users paid **21,349 ETH** in Q3 network fees: **1,927 ETH** in July, **2,951 ETH** in August, and **16,471 ETH** in September. September's native fee total grew **458.15%** versus August.

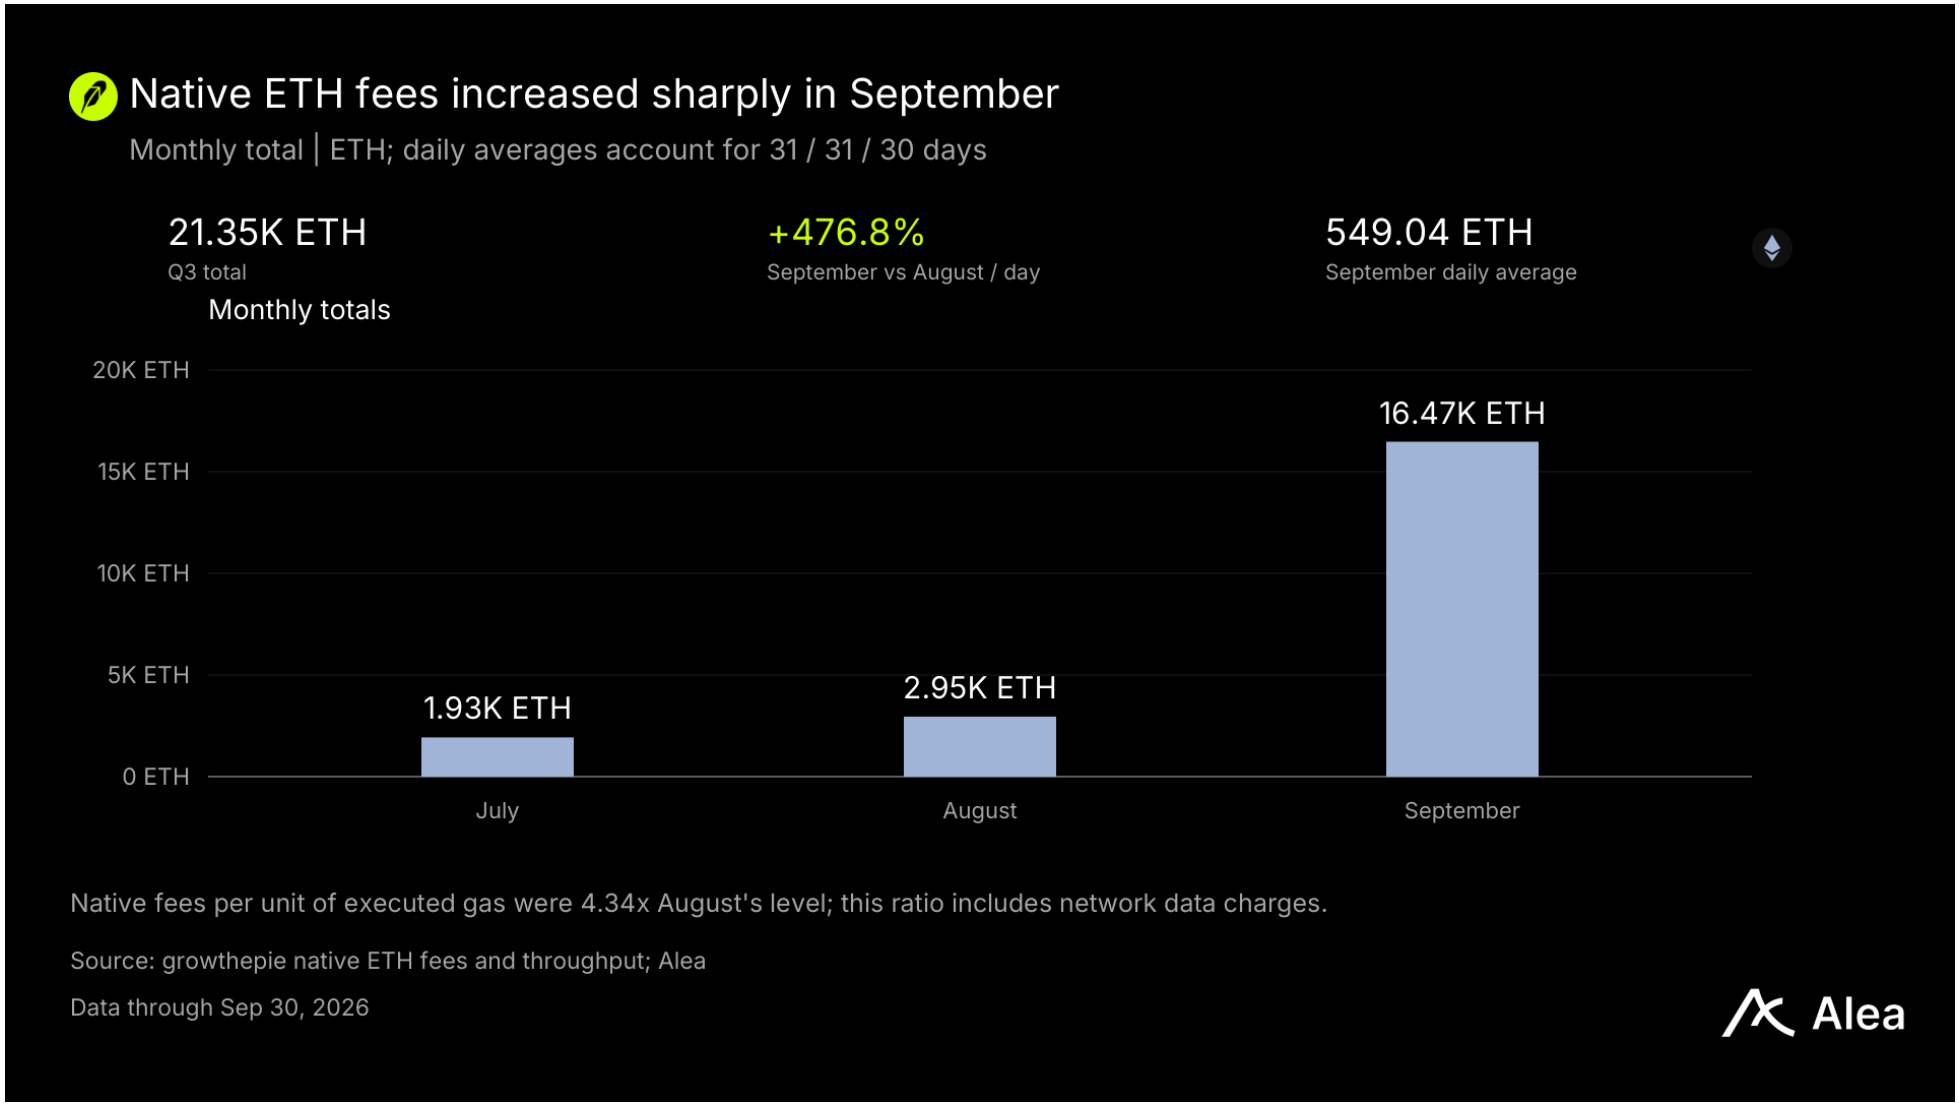

Figure 27. Monthly network fees paid in ETH, with daily-average and MoM context.

September's native fees grew faster than executed gas. Native fees per unit of executed gas were **4.34x** August's level. The month combined more executed work with higher ETH fee intensity.

August 30 to September 10 generated **$32.84M** in network fees, or **71.13%** of Q3's total.

The interval averaged **$2.74M/day**, compared with **$117.21K/day** during the prior 60 days and **$314.66K/day** during the final 20 days.

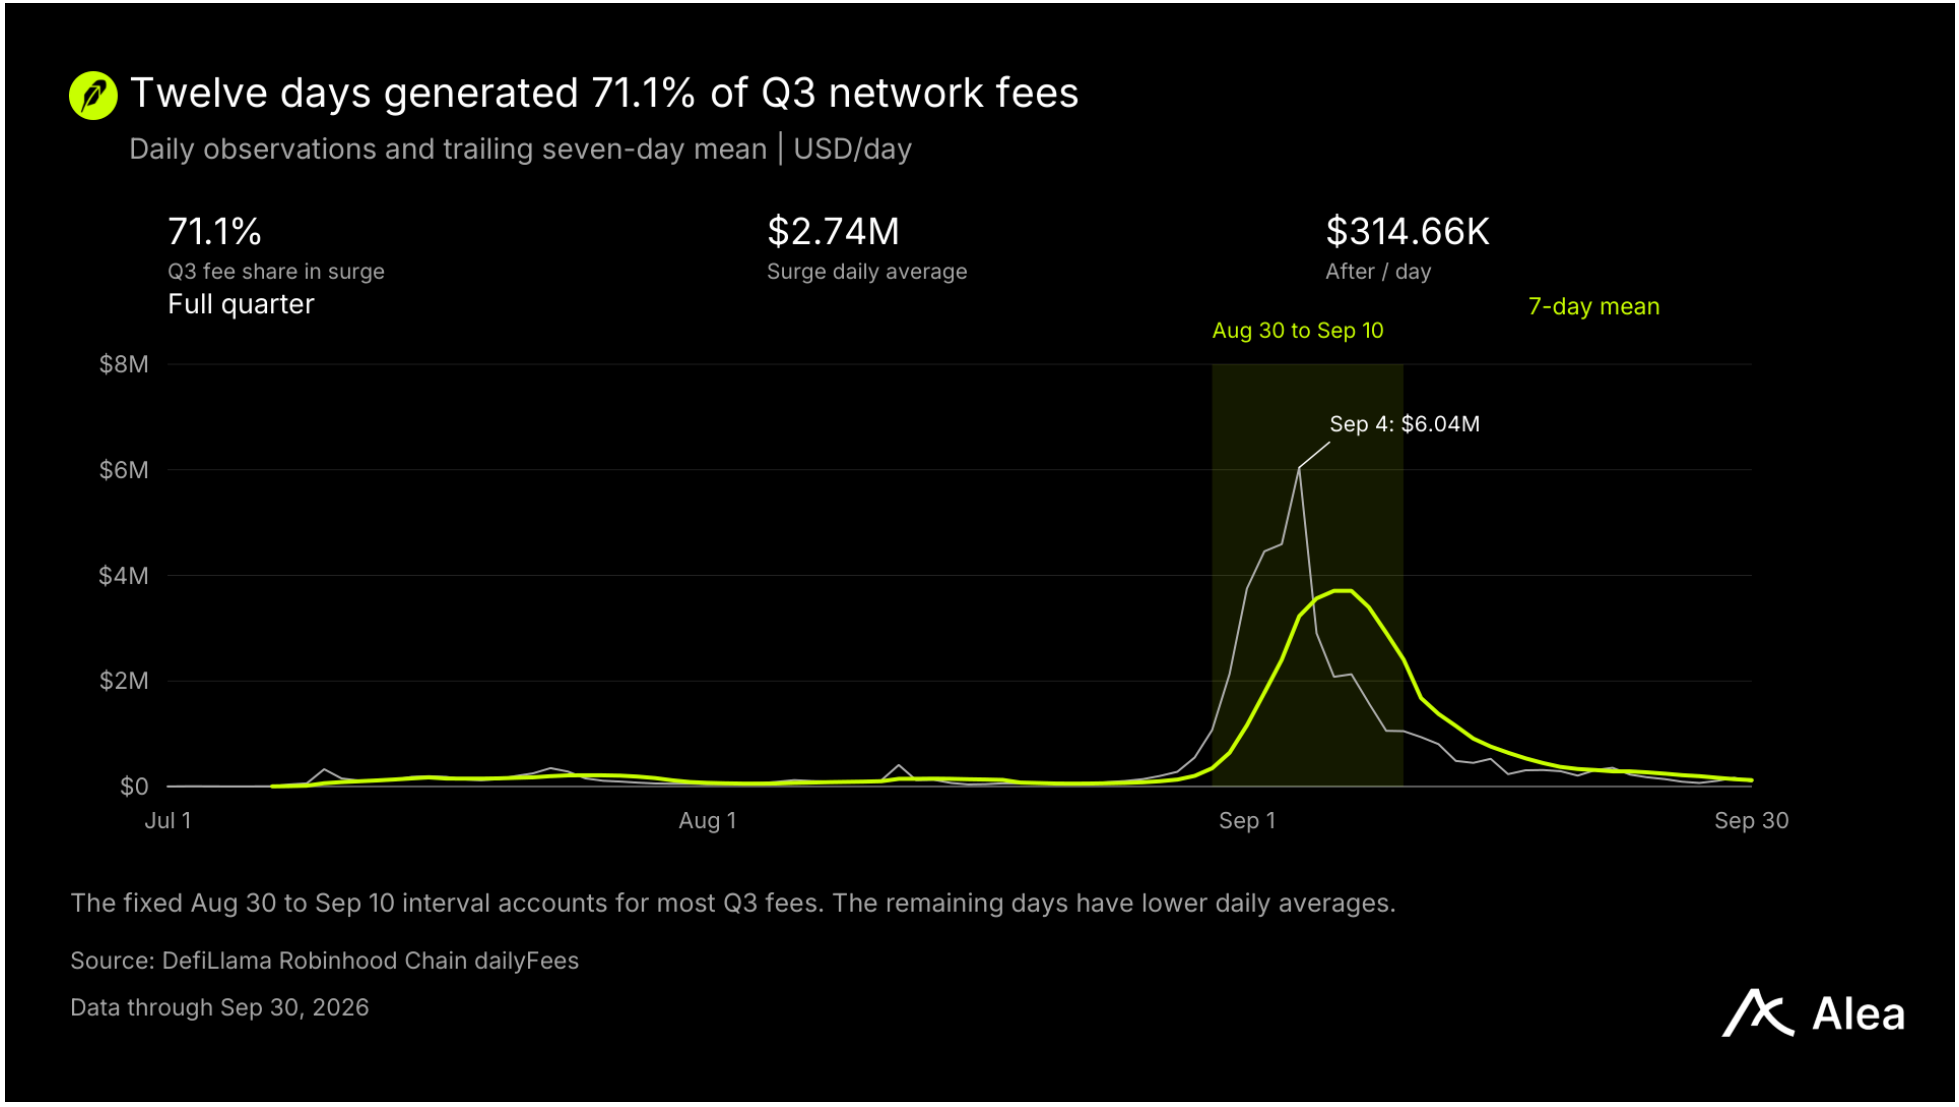

Figure 28. The full-quarter network fee path, with the 12-day surge highlighted.

The quarterly fee total was dominated by 12 days. Fees during the remaining periods were much lower, making the surge distinct from the chain's later operating rate.

After the surge, transactions averaged **8.70M** per day against **8.10M** beforehand. Spot turnover averaged **$1.58B** against **$522.82M**. Both increased while daily fees fell from the peak.

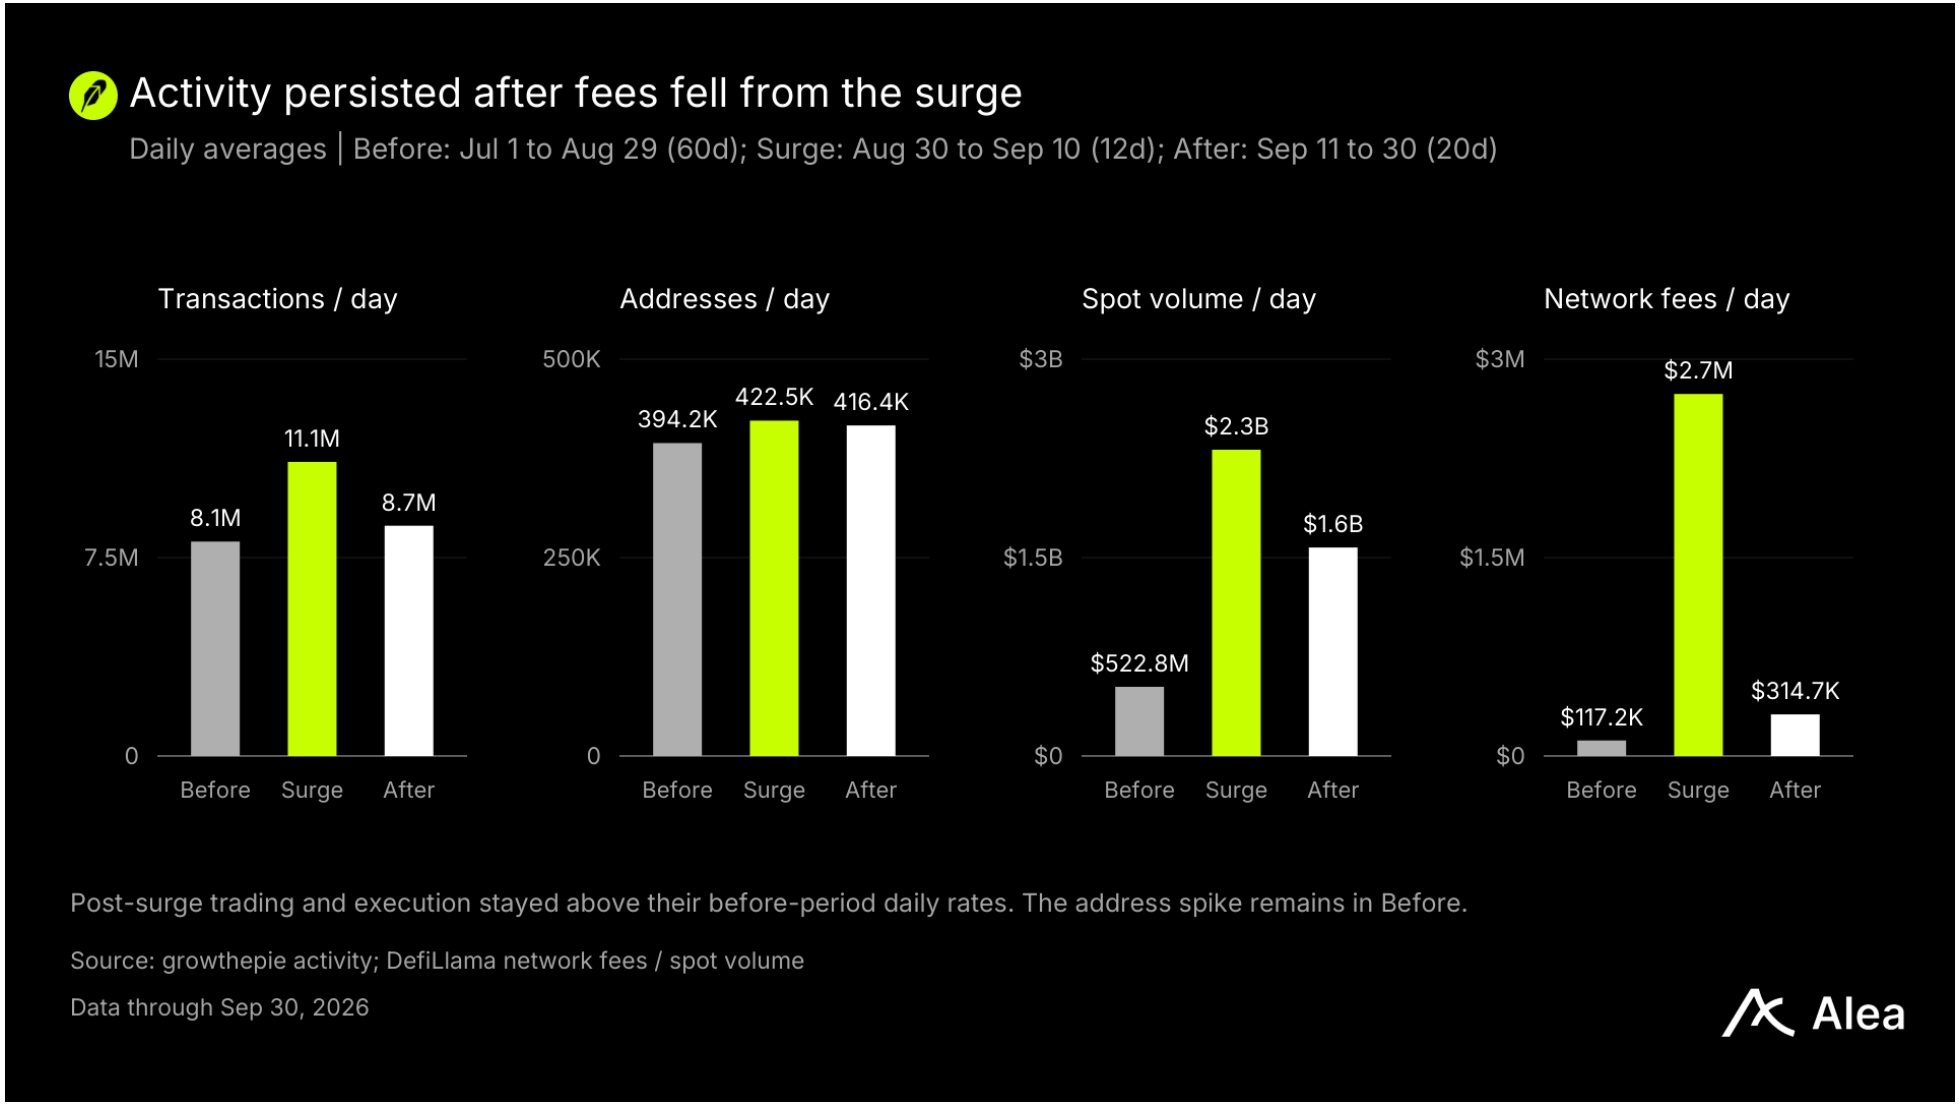

Figure 29. Daily-average comparisons contrast execution with trading and fees across the three fixed surge windows.

The post-surge period combined more trading and execution than the earlier baseline with much lower fees than the peak. The before-period address mean includes August 12.

Monthly network fees were **$3.59M** in July, **$6.65M** in August, and **$35.93M** in September. September supplied **77.83%** of Q3 fees and grew **440.61%** versus August, or **458.63%** per day.

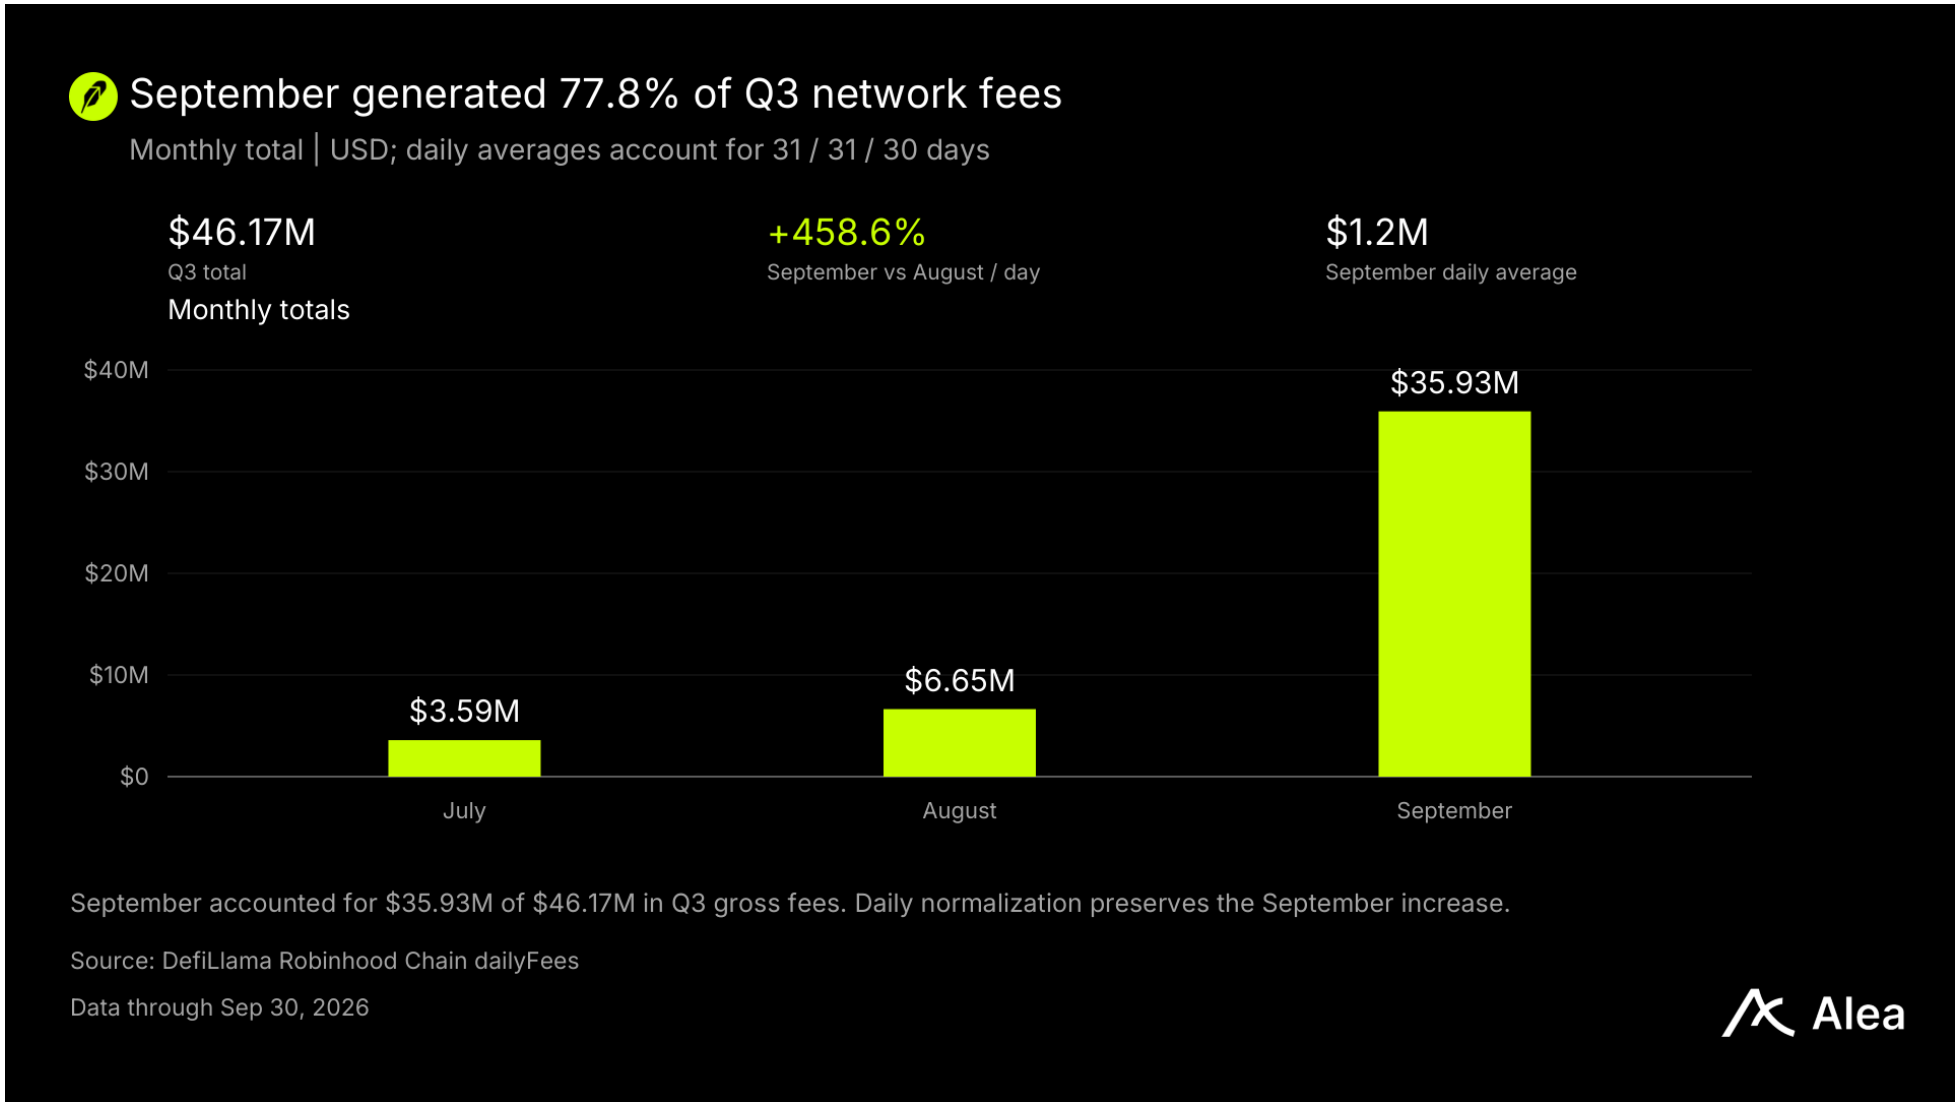

Figure 30. Monthly gross network fees, with daily averages and September growth.

Most of September's fees accrued in its opening ten days. Later trading and execution continued at lower network-fee levels.

Gross network fees totaled **$46.17M**. Post-license chain revenue reached **$41.49M**, or **89.86%** of gross fees. Ethereum costs and the Arbitrum license claim reduced the total by **$4.68M**.

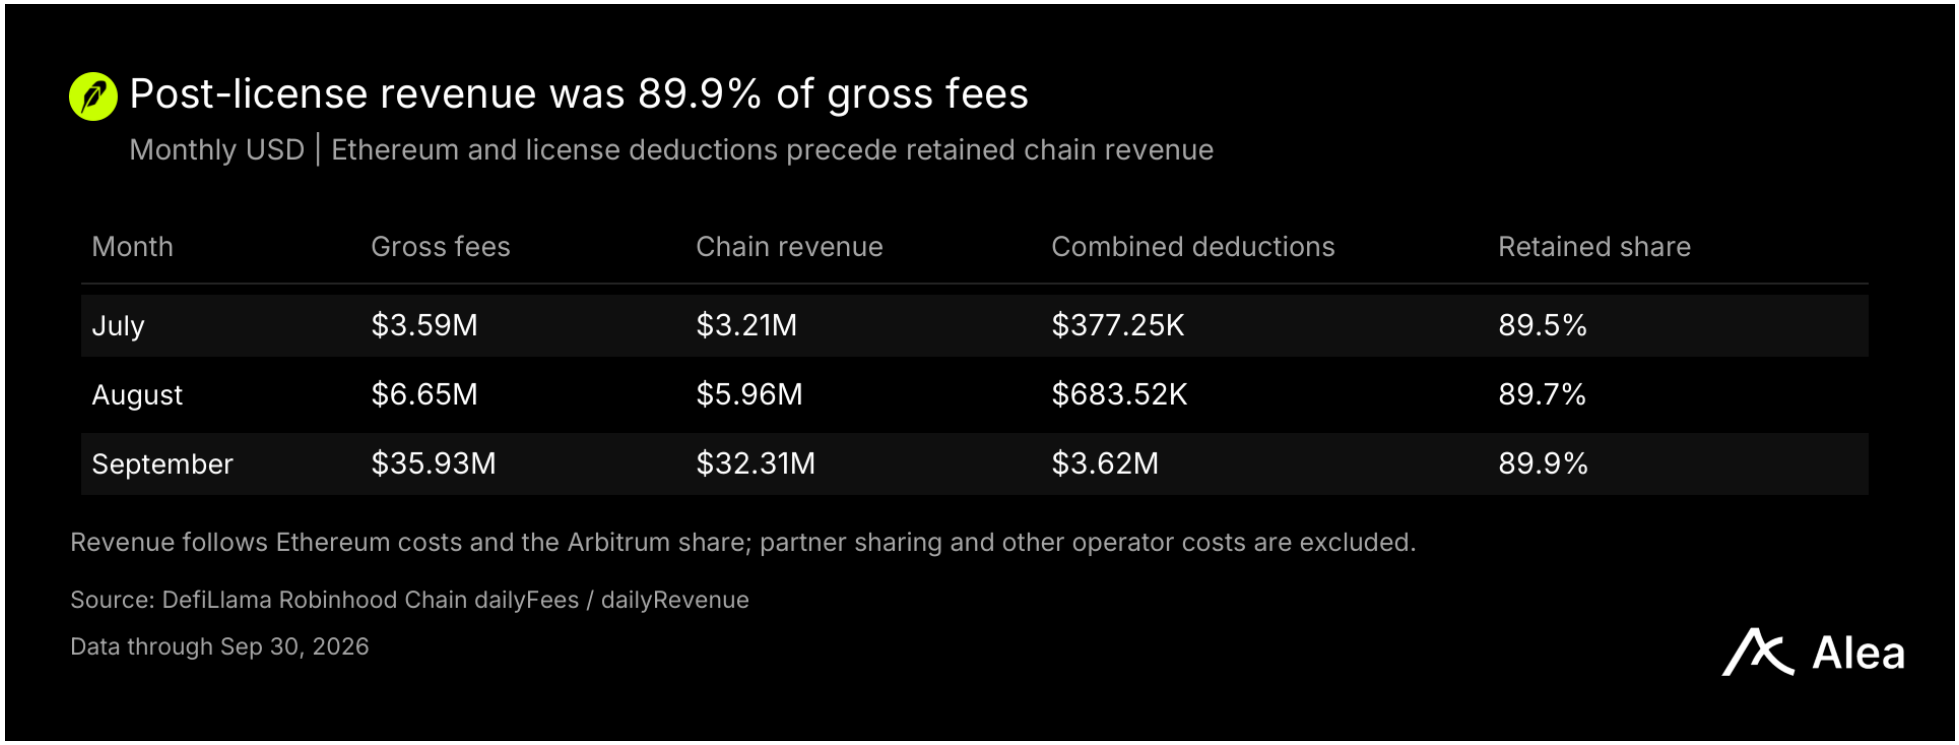

Figure 31. Monthly gross network fees and retained chain revenue.

Chain revenue follows those deductions and precedes launch-partner sharing and other operator costs. It measures sequencer proceeds at that stage of allocation, rather than Robinhood's corporate profit.

Robinhood and its launch partners share sequencer revenue under approximate cumulative thresholds disclosed September 10. Robinhood receives **50%** through **$50M** and **70%** from there to **$150M**. Above that level, its share rises to **85%**.

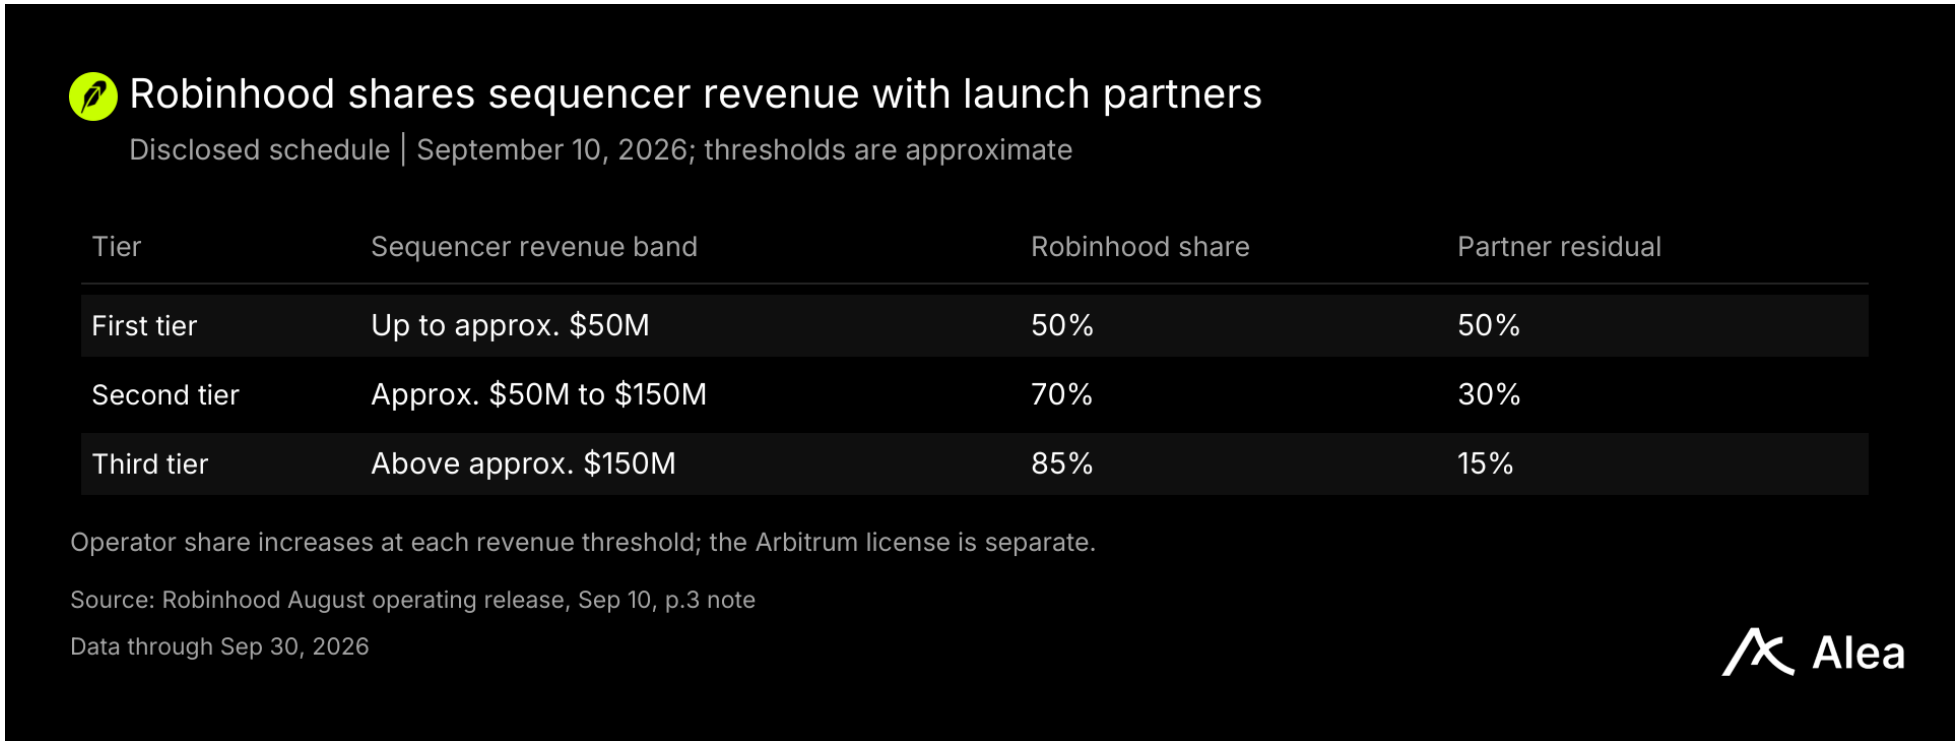

Figure 32. Disclosed Robinhood launch-partner sequencer revenue-sharing tiers.

Robinhood's contractual share rises as cumulative sequencer revenue crosses each threshold. The schedule allocates proceeds between Robinhood and its partners; it is separate from the Arbitrum license.

Applications generated **$592.85M** in gross fees and retained **$146.50M**, a **24.71%** retained share. Monthly shares eased from **26.29%** to **24.62%** and **24.25%**.

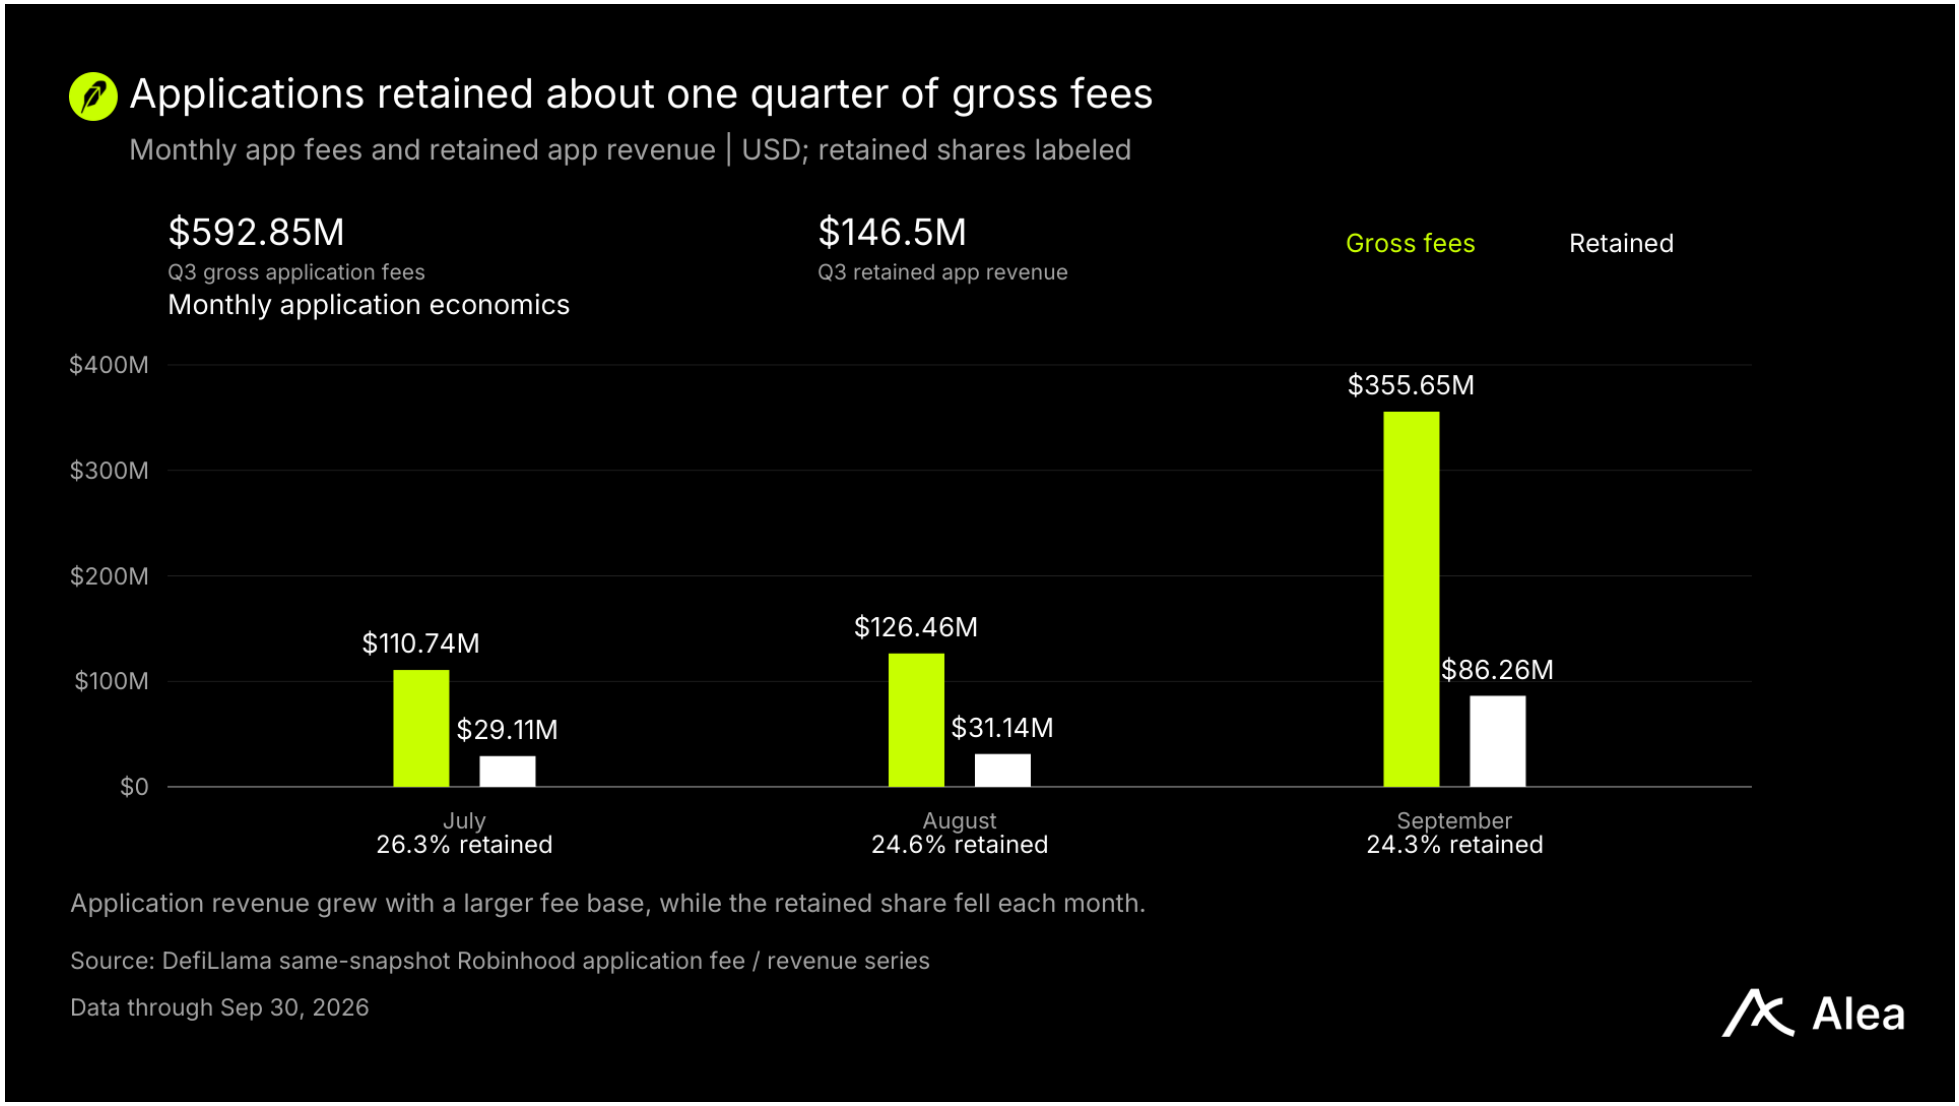

Figure 33. Monthly gross application fees and retained application revenue, with retained shares.

App revenue increased as gross fees grew, despite a lower retained percentage. The larger fee base outweighed the decline in the share retained by application recipients.

GMGN retained **$46.11M**, Pons V2 **$26.56M**, and fomo Wallet **$20.15M**. Together they supplied **63.36%** of app retained revenue. Uniswap V3 ranked fourth at **$13.71M**.

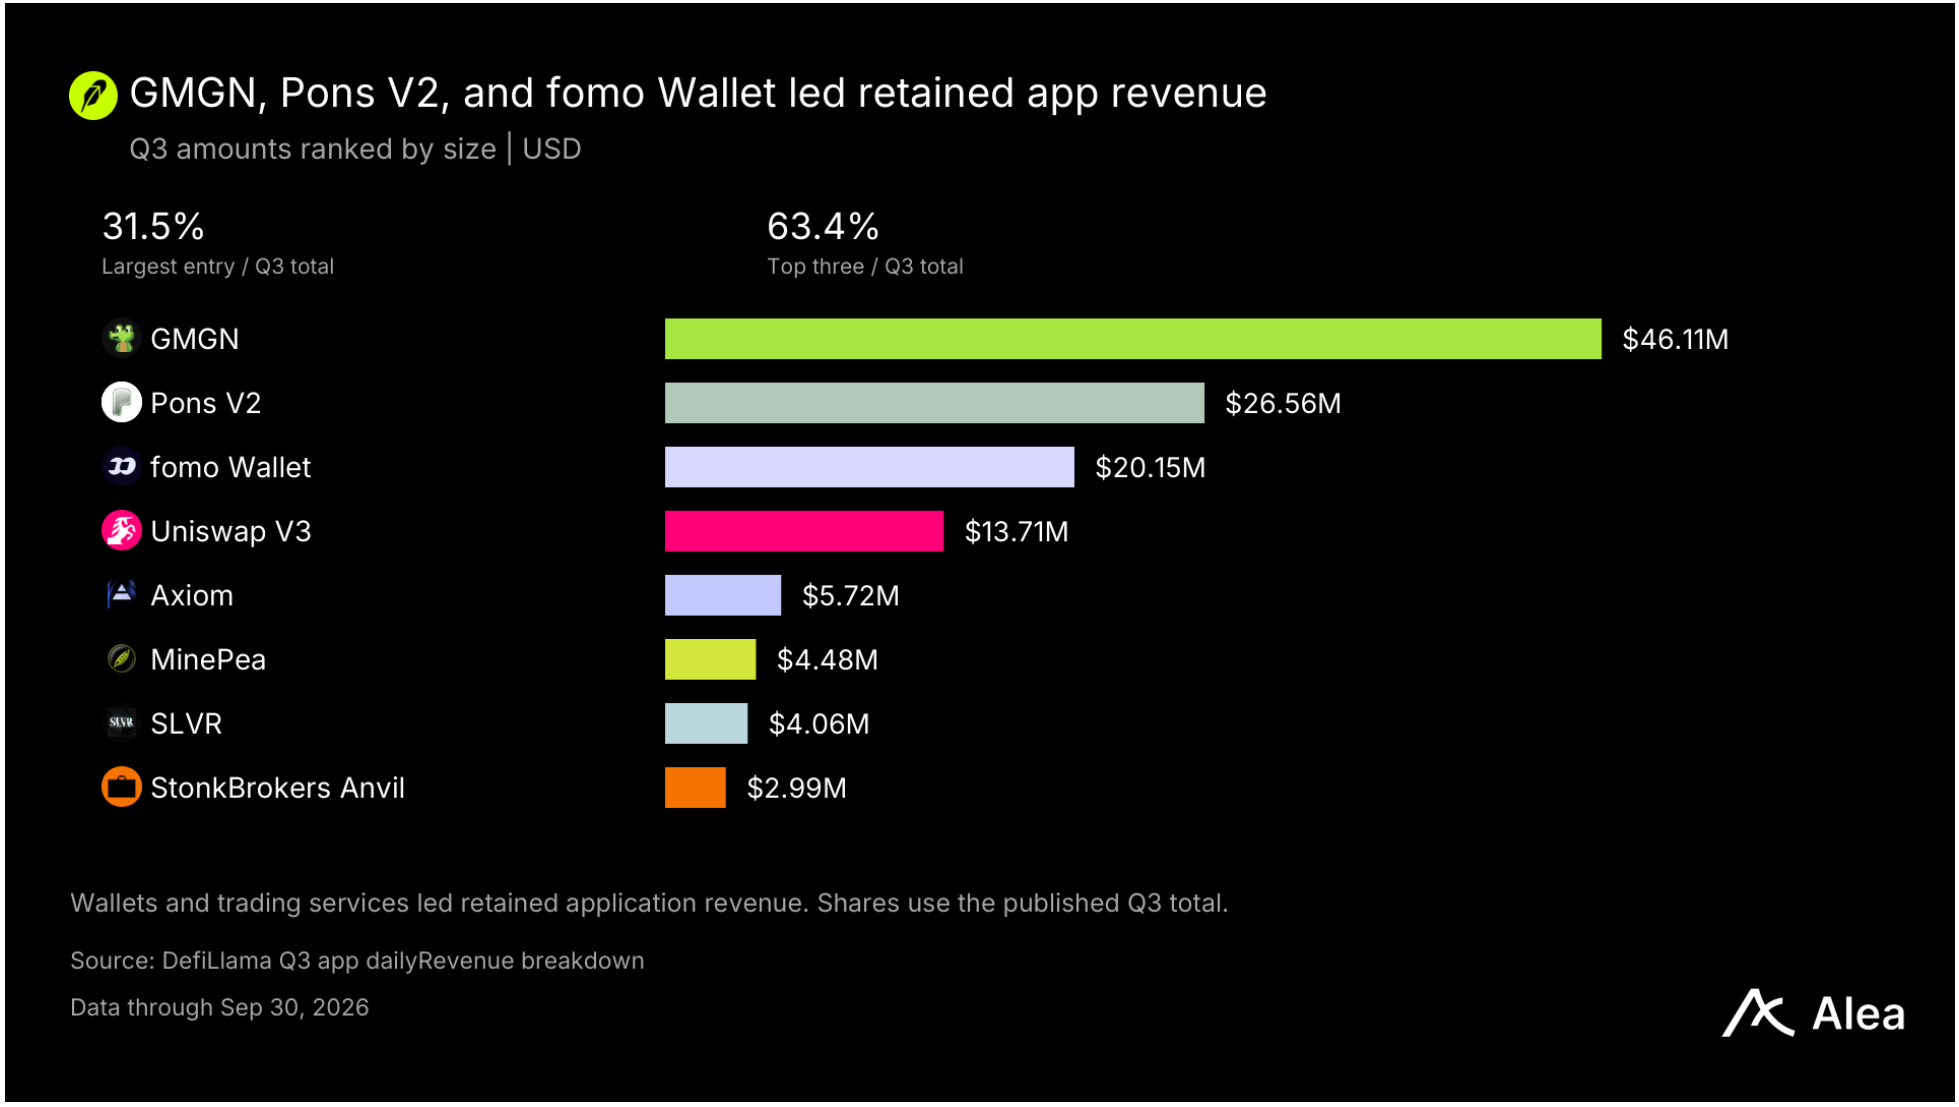

Figure 34. Q3 retained application revenue by recipient.

Wallets and trading services earned fees alongside exchange contracts. Application receipts depend on service charges and fee splits, producing a different ranking from gross DEX turnover.

Peer Comparison

Robinhood's **$90.67B** in spot turnover exceeded Base's **$73.45B**, Arbitrum One's **$16.43B**, and OP Mainnet's **$2.27B**. Robinhood traded more than Base against a daily-average TVL of **$545.37M**, compared with Base's **$5.07B**.

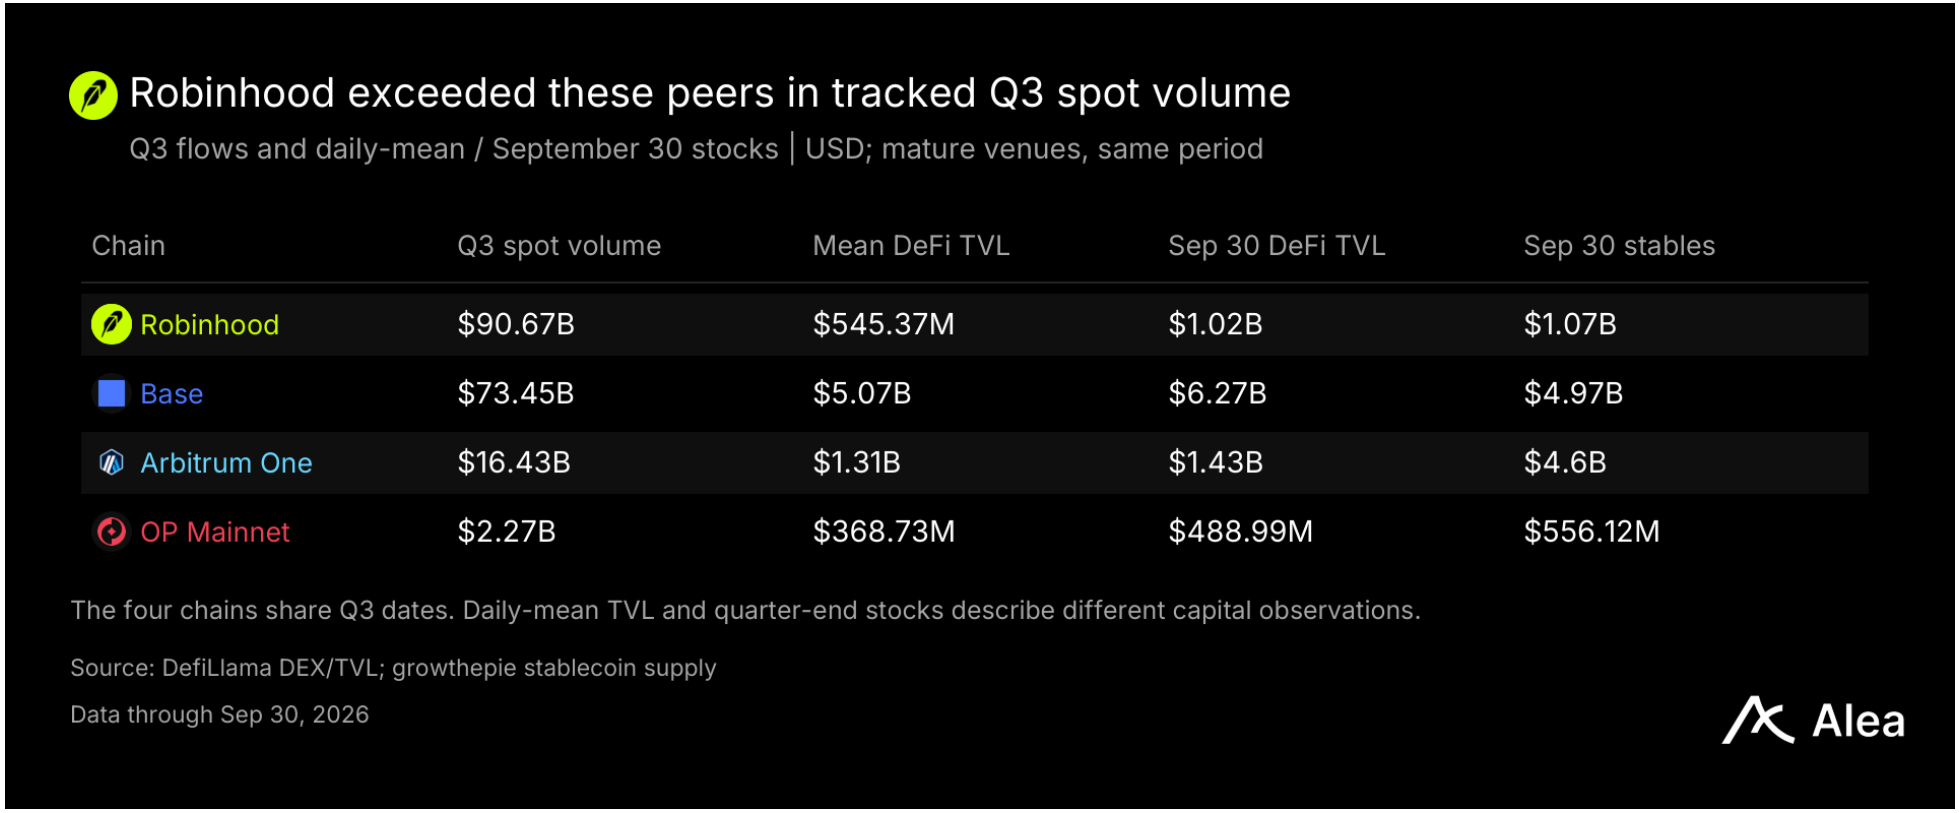

Figure 35. Same-quarter spot turnover, mean DeFi TVL, quarter-end TVL, and stablecoin balances for the four declared peers.

The peer set compares Q3 venue scale: Base, Arbitrum One, and OP Mainnet are established Ethereum L2s with different launch dates and capital bases.

Robinhood's transaction total was close to Base's, while network fees were **4.71x** Base's total. Gross fees per transaction were **$0.0582** on Robinhood and **$0.0123** on Base. Robinhood's **$0.0254** mean daily median cost uses a different weighting.

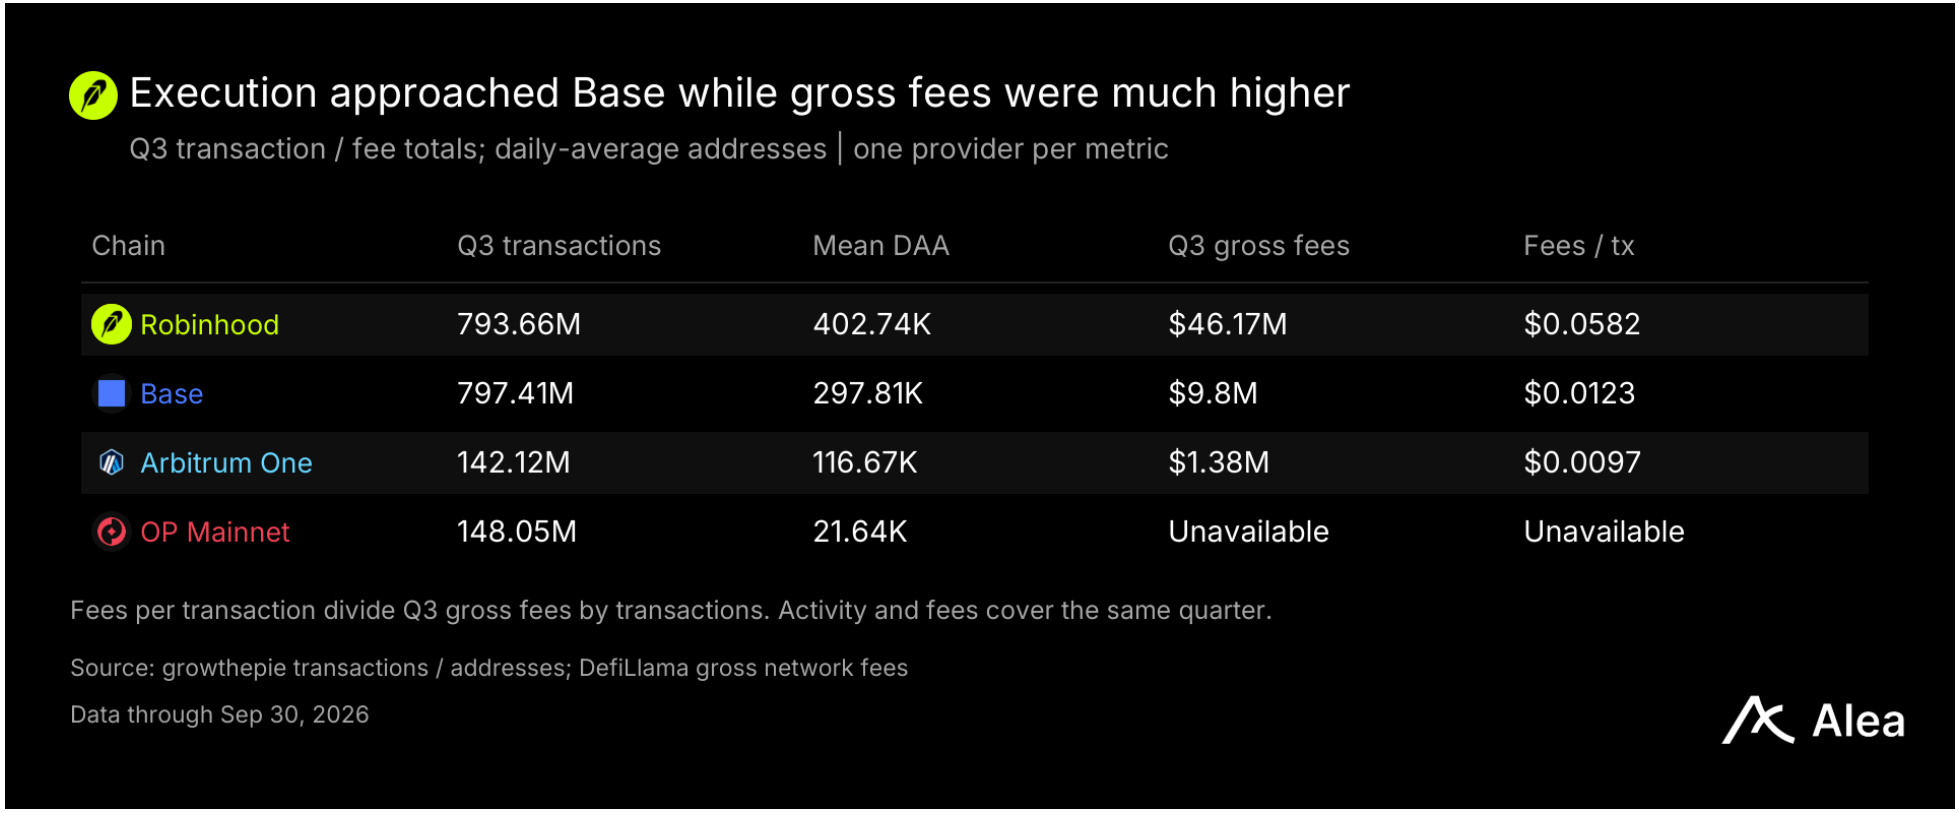

Figure 36. A peer scorecard puts quarterly execution beside fees and average daily address counts.

Robinhood collected more fees from a similar transaction count. Its concentrated fee peak lifted quarter-average fee intensity. The fee comparison includes Arbitrum One alongside Robinhood and Base.

Mean daily transactions divided by mean daily active addresses were **21.42x** on Robinhood and **29.10x** on Base. Arbitrum One's ratio was **13.24x**, against OP Mainnet's **74.36x**.

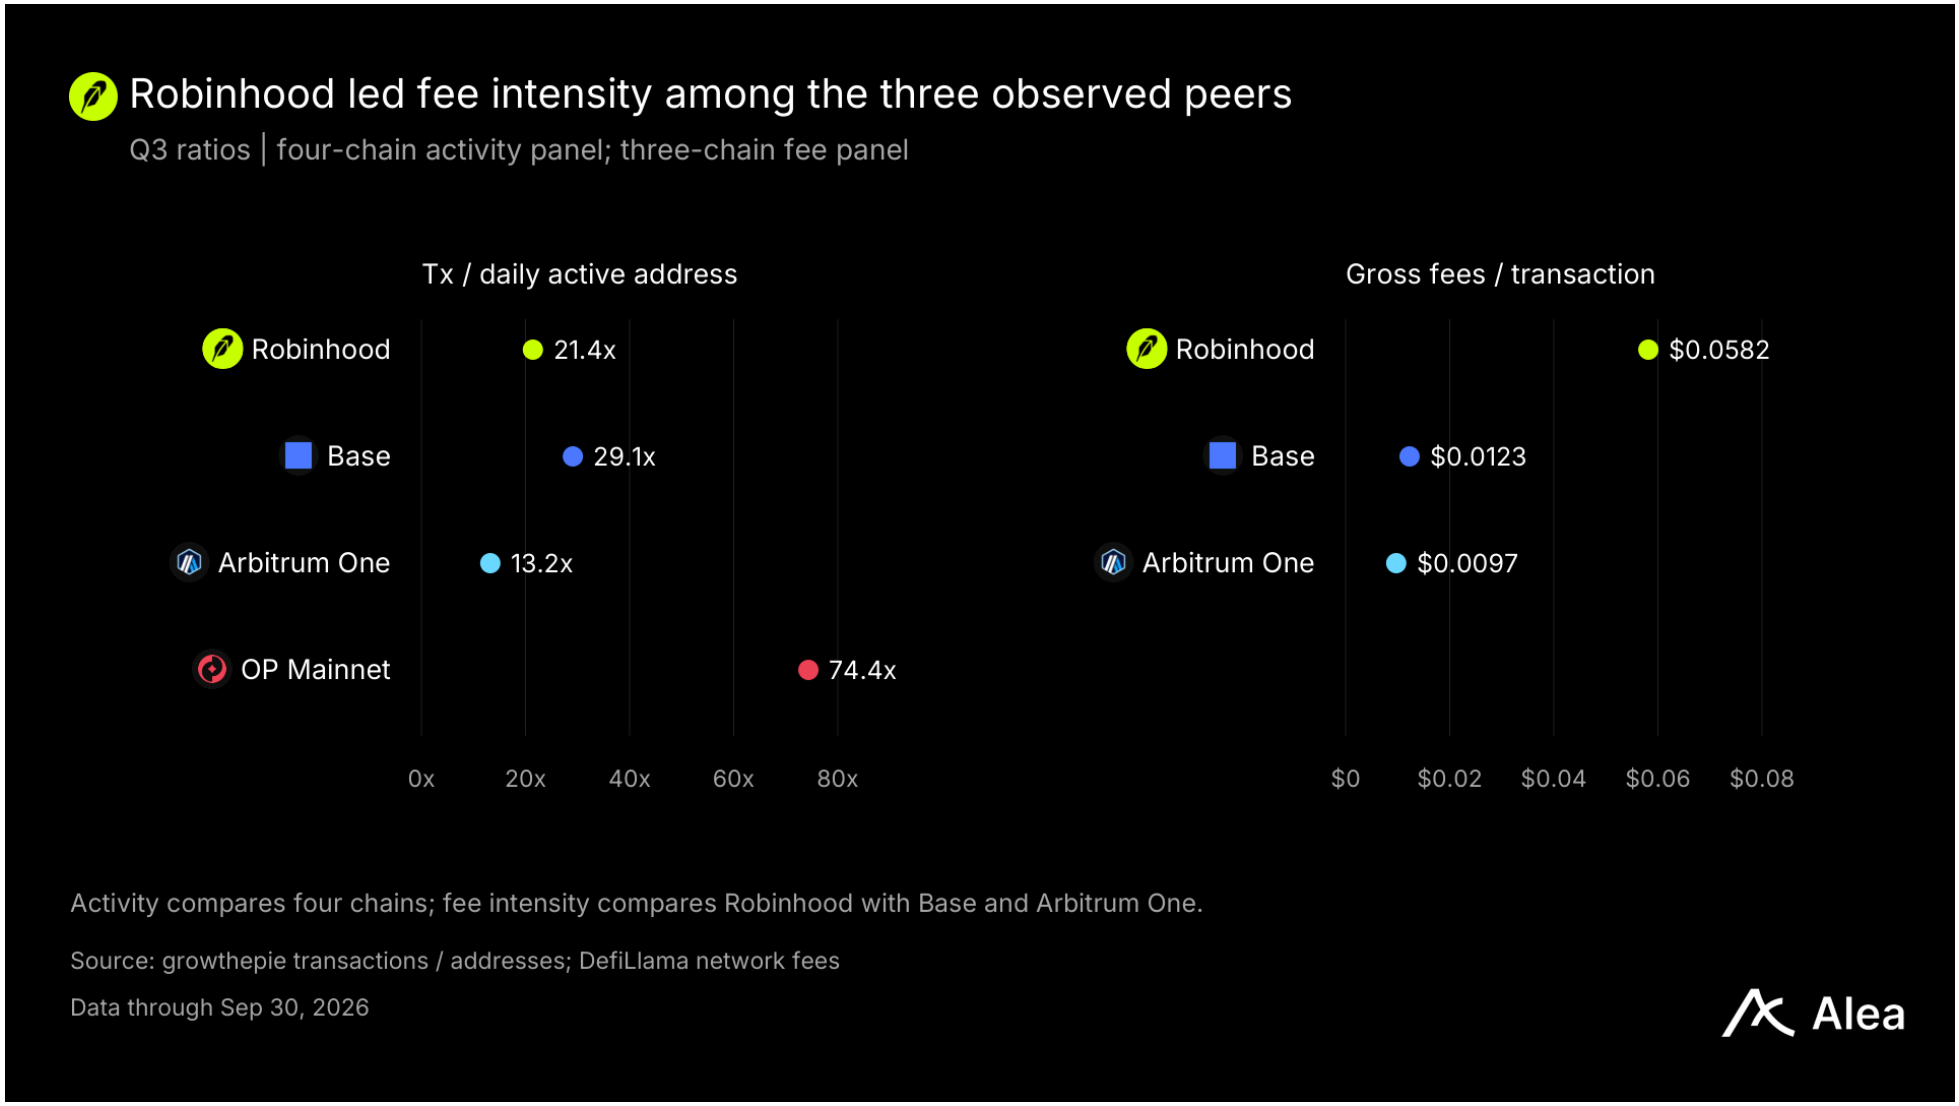

Figure 37. Peer aggregate transaction-to-address ratios and gross fees per transaction in separate panels.

OP Mainnet had the highest aggregate transaction-to-address ratio. Robinhood sat below Base and above Arbitrum One.

Conclusion

Robinhood Chain ended its first public quarter with larger capital balances and higher daily spot turnover than in July. August led transaction and address counts. September led trading and fees while executing more gas. Stock-token value reached **$160.81M**, with equity exposure comprising most of the balance. September supplied **79.4%** of stock-token Q3 turnover.

The 12-day fee surge generated **71.13%** of Q3's **$46.17M** in network fees. The final 20 days kept trading and execution above their earlier daily rates as fees fell. Applications retained **$146.50M** across the quarter; sequencer proceeds after Ethereum and license costs were **$41.49M**, before launch-partner sharing and other operator costs.
