## Chapter 2 • What You Are Buying

By Dimitris Pechlivanidis · Senior Analyst, Alea Research

### Ownership and Investor Rights

Ownership determines the investor's claim and counterparty, along with the shareholder rights related to the product. Two tokens tracking NVIDIA can deliver similar returns while giving holders different legal positions. With a usual brokerage purchase, investors generally hold beneficial ownership of NVIDIA shares through the custody system. With a tokenized product, the legal structure determines whether the holder owns company equity, a custodial interest, or a separate instrument linked to the shares.

Figure 1 NVDA token versions visible in a single wallet

SEC staff recently published a tokenization [taxonomy](#) statement for tokenized securities that groups them into issuer-sponsored and third-party products and within third-party products, it distinguishes custodial interests from synthetic exposure.

Ownership and Investor Rights

| Structure                             | Holder's legal position                                                                         | Typical rights                                                                                              | Closest examples                                               |
|---------------------------------------|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Issuer-sponsored share</b>         | Company-issued equity, with ownership recorded through the issuer's or transfer agent's system. | Rights of the relevant share class, subject to transfer and eligibility rules.                              | Securitize, Superstate, Figure                                 |
| <b>Third-party custodial interest</b> | A beneficial interest or security entitlement in shares held through a custodian.               | Economic rights and corporate actions; voting and information access vary. Redemption depends on the terms. | bStocks, Dinari dShares (non-U.S.), Coinbase Tokenized Stocks. |

| Structure                          | Holder's legal position                                                             | Typical rights                                                                                    | Closest examples                             |
|------------------------------------|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|----------------------------------------------|
| <b>Third-party linked security</b> | An obligation issued by the token provider, even when real shares collateralize it. | Price exposure and stated dividend treatment; generally no rights against the underlying company. | Ondo Stocks, xStocks, Robinhood Stock Tokens |

Under **issuer-sponsored** tokenization, the company or its agent uses tokenization to issue, record, or transfer the company's shares. The blockchain does not have to serve as the only authoritative ledger in this case. Tokenized SECZ through **Securitize** and GLXY through **Superstate** represent the same common shares traded on traditional exchanges, not separate wrappers or share classes. The company remains the issuer, while its transfer agent and eligibility rules determine how ownership is recorded and transferred.

Carlos Domingo CEO & Co-founder, Securitize

## 1 · ISSUER-SPONSORED

**Tokenized company share**

Holder owns the company's share.

Examples: Securitize · Superstate

## 2 · THIRD-PARTY

**Custodial interest**

Holder owns a direct or indirect interest in the underlying share.

Examples: bStocks · Dinari (non-U.S.) · Coinbase

## 3 · THIRD-PARTY

**Linked security**

Holder owns the issued instrument, not the referenced share.

Examples: Ondo · xStocks · Robinhood

Figure 2 Three ownership structures behind tokenized stocks

**Custodial** models give investors an indirect interest in shares held through intermediaries, rather than direct registration on the underlying company's shareholder register. For non-U.S. dShares, **Dinari** describes underlying securities held in a brokerage account in its name on holders' behalf. Standard dShares receive eligible cash dividends in USD+, while wrapped dShares accumulate additional underlying dShares. Stock splits adjust standard dShare balances, and redemption returns stablecoin proceeds from selling the underlying shares.

**Coinbase's** Vested Holders have a proportionate beneficial interest in the deposited property (AAPL [prospectus](#) for reference). Unvested Holders instead have a beneficial interest in certificates held for them by the issuer and cannot redeem or submit voting instructions until they complete KYC and the other vesting conditions (see FAQ [here](#)). Vested Holders may submit voting instructions, but the issuer does not guarantee voting participation. Cash dividends are generally reinvested net of applicable withholding taxes, a distribution fee equal to 5% of the gross dividend, and other applicable charges.

Holding a **bStock** gives investors a certificate backed by the corresponding shares and issued by BTech Holdings with zero commission, custody, management, or conversion fees. They receive the stock's price performance and reinvested dividends after the mandatory deductions, but no shareholder or voting rights. Eligible users (Binance Stock Trading access) can convert the stock token into the underlying share through Binance.

A **third-party linked instrument** gives investors the rights embedded in the wrapper, not ownership of the referenced company. **Ondo** holders own a structured note and therefore a debt claim against its issuing SPV. **xStocks** holders own a bearer debt instrument structured as a tracker certificate, while **Robinhood** Stock Token holders own a debt security issued by RHJ.

All three pass through dividend value through automatic reinvestment rather than cash distributions. Reinvestment increases the underlying equity exposure represented by the holding, reflected through shares-per-token adjustments or adjusted token balances.

## Backing, Custody, and Protection

Ownership defines the investor's claim while backing identifies the assets behind it and the holder's access to them if an intermediary fails. The two are not interchangeable because a token can be marketed as 1:1 backed by NVDA even though its holder owns a certificate or debt security instead of an actual NVIDIA share.

Issuer-sponsored tokens can represent the shares themselves, so there is no separate backing share. Custodial products represent an interest in securities held on investors' behalf. Linked securities are separate instruments whose obligations may be secured by the referenced shares. Ondo's structured notes, for example, are backed by the corresponding securities and cash in transit, plus additional collateral. Those assets secure the issuer's obligations but do not make token holders shareholders in the underlying company.

Backing, Custody, and Protection

| Platform                               | Backing and custody                                                                                                                                | Investor's claim                                                                                                                                                                                   |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Securitize, Superstate</b>          | No separate pool of backing shares: the tokenized share is part of the issuer's equity and remains connected to its official shareholder register. | Ownership of the issuing company's equity, rather than a claim against a separate wrapper issuer.                                                                                                  |
| <b>Coinbase Stock Tokens</b>           | Underlying shares held at Alpaca Securities in segregated issuer accounts under a trust arrangement.                                               | Beneficial interest through the trust structure. Recourse limited to deposited property and proceeds. Vested Holders may submit voting instructions but do not own the underlying shares directly. |
| <b>Dinari dShares (non-U.S. model)</b> | 1:1 underlying securities held at Alpaca Securities in a custodial account in Dinari's name, separate from its operating accounts.                 | Economic rights to underlying securities held on the holder's behalf through Dinari's custodial arrangement; not direct registered share ownership.                                                |
| <b>xStocks</b>                         | 1:1 underlying securities held with regulated custodians in segregated accounts.                                                                   | Secured debt claim against the issuer, not ownership of the underlying shares. An independent security agent can enforce collateral rights following default.                                      |
| <b>bStocks</b>                         | 1:1 underlying securities held with Alpaca as custodian.                                                                                           | A certificate representing a beneficial interest in the underlying securities, not direct ownership of the shares.                                                                                 |
| <b>Ondo</b>                            | Underlying stocks/ETFs, cash in transit and additional collateral. Securities held through regulated custodial brokers.                            | Secured debt claim against the issuing SPV. Ankura Trust can enforce collateral rights in specified default events.                                                                                |
| <b>Robinhood Stock Tokens</b>          | 1:1 underlying-share backing through Alpaca Securities, supporting the issuer's obligations.                                                       | Debt claim against Robinhood Assets (Jersey) Limited, with collateral enforcement through an independent security agent; no legal or beneficial ownership of the underlying shares.                |

In case of issuer default, recovery depends on which entity fails and the holder's legal rights to the assets. Custodial holders rely on an enforceable interest in securities held for them; secured-wrapper holders rely on their claim against pledged collateral. Segregation and bankruptcy remoteness can reduce risk, but neither guarantees immediate or complete recovery. A custodian's SIPC membership alone does not establish that every token holder qualifies as a customer entitled to coverage.

Anna Wroblewska Chief Business Officer, Dinari

## Jurisdiction and Access

Several leading stock-token products exclude U.S. persons, but non-U.S. access is not uniform. Eligibility can depend on country, investor status, venue, and activity. Secondary trading may be available even when direct issuance or redemption is not.

Jurisdiction and Access

| Product | Investor access | Practical limit |
|---------|-----------------|-----------------|
|---------|-----------------|-----------------|

| Product                          | Investor access                                                                                                                                                                                                                                                                 | Practical limit                                                                                                                                                        |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Coinbase Tokenized Stocks</b> | Eligible non-U.S. users.                                                                                                                                                                                                                                                        | AP minting; vested-holder redemption under the prospectus. Retail access requires confirmation.                                                                        |
| <b>Ondo Stocks</b>               | U.S. persons and Canadian residents are excluded. Many products are available to retail and professional investors in relevant EEA states, while some remain professional-only. Access in the UK, Switzerland, and Singapore is limited to qualified or professional investors. | Direct purchase and redemption require KYC.                                                                                                                            |
| <b>xStocks</b>                   | U.S. persons are excluded. Licensed distributors can serve EEA retail investors.                                                                                                                                                                                                | Direct retail redemption requires KYC and a \$5,000 minimum.                                                                                                           |
| <b>Dinari dShares</b>            | International and U.S. models differ. U.S. customers use fully disclosed brokerage accounts, with dShares serving as a secondary ownership ledger.                                                                                                                              | U.S. tokens are currently nontransferable and unavailable for DeFi.                                                                                                    |
| <b>Robinhood Stock Tokens</b>    | U.S., Canadian, UK, and Swiss investors are excluded.                                                                                                                                                                                                                           | Only Authorized Participants mint directly. Redemption normally runs through them, with direct issuer redemption available when none is available, subject to KYC/AML. |
| <b>bStocks</b>                   | U.S. persons are excluded. Other permitted jurisdictions receive secondary-market access.                                                                                                                                                                                       | Eligible users can convert through Binance and Nest Trading Limited into underlying securities credited to their platform sub-account.                                 |

These restrictions decide whether an investor can access the primary market, trade on a secondary venue, withdraw to self-custody, transfer the token, use it in DeFi, or redeem it with the issuer. The above terms and restrictions apply as of September 22, 2026.

## 24/7 Trading

Around-the-clock trading is one of the main value propositions of tokenized stocks, and it can describe four different functions: blockchain transfers, secondary trading, primary creation and redemption, and trading in the underlying stock. A token may move between wallets at any time while the issuer only creates or redeems during supported sessions. A venue may also quote the token over a weekend even though the U.S. cash market and the issuer's main hedge are closed.

Trading schedules differ by product and platform and sometimes by asset.

24/7 Trading

| Platform / product            | Standard trading window        | Weekend trading                 | Off-hours mechanics                                                                                    |
|-------------------------------|--------------------------------|---------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Ondo Stocks</b>            | Generally 24/5                 | Selected assets                 | Separate weekend/holiday session, wider spreads and dynamic limits may apply.                          |
| <b>xStocks</b>                | Most Kraken markets 24/5       | 10 selected Kraken Pro markets. | Availability depends on the asset and venue.                                                           |
| <b>bStocks</b>                | 24/7 on Binance Spot           | Yes                             | Continuous exchange order book.                                                                        |
| <b>Robinhood Stock Tokens</b> | 24/7 onchain secondary trading | Yes                             | Mint/burn limited to Mon 02:00–Sat 02:00 CET/CEST; secondary trading can continue outside this window. |
| <b>Reality rTokens</b>        | Pre-market through overnight   | Asset-specific                  | Bitget flags weekend eligibility token by token.                                                       |

| Platform / product               | Standard trading window | Weekend trading   | Off-hours mechanics                                                          |
|----------------------------------|-------------------------|-------------------|------------------------------------------------------------------------------|
| <b>Coinbase Tokenized Stocks</b> | 24/7 on Base            | Yes               | Liquidity is split across permissionless Base venues.                        |
| <b>Dinari dShares</b>            | 714 assets support 24/5 | 9 selected assets | Order types and routes narrow off-hours; weekend trading is blockchain-only. |

24/7 access now accounts for a substantial share of tokenized-stock trading. During most of September, 49% of Kraken volume, 56% of Binance volume, and 58% of Robinhood volume occurred outside U.S. regular hours, while weekends alone contributed consistently 10%–16% month over month (July to September).

Figure 3 Trading value by U.S. stock-market session, by venue

Chain-level data shows that this behavior extends beyond individual venues. Across Solana, Robinhood Chain, BNB Chain, and Base, 60%–69% of tokenized-stock spot volume occurred while U.S. markets were closed.

U.S. market hours run from 9:30 a.m. to 4:00 p.m. ET on trading days.

Powered by 

Figure 4 Tokenized stocks: trading volume during U.S. market hours, by chain

Note that off-hours cover most of the week, so trading remains more concentrated when U.S. exchanges are open. The underlying market still supplies most liquidity and price discovery.

# Chapter 3 • Tokenized Stock Ecosystem: Overview Of Key Players

By Dimitris Pechlivanidis · Senior Analyst, Alea Research

New platforms expanded the market beyond Ondo and xStocks in 2026 and created a multi-platform competitive landscape.

Figure 5 Tokenized stock platform ecosystem

Ondo and xStocks controlled **76.2%** of value in January. Today, Ondo and bStocks hold **53.4%** of the total market, with xStocks ranking third. New competitors such as bStocks and Robinhood reshaped the market, so six platforms now each hold roughly 5% or more. Distribution via exchanges, brokerages, and wallets now matters as much as first-mover advantage.

Figure 6 Platform share of tokenized stock value

Ondo's share fell from 61.4% in May to 28.4% in September. New entrants expanded while Ondo's distributed value declined by roughly 20%, amplifying the loss of market share. In the meantime, bStocks reached 25% within roughly 3 months.

Figure 7 Platform share of tokenized stock value over time

Robinhood's 334% increase partly reflects its small starting base, but it still added about \$120M of market value in 30 days. bStocks added even more in absolute terms at roughly \$173M. Recent growth came from new products, while several established platforms stayed flat or contracted.

Figure 8 30-day growth in tokenized stock value

xStocks, Reality, and Dinari offer large catalogs, but average value per product remains low. bStocks, Robinhood, and Ondo on the other hand, concentrate more capital in fewer products. Securitize stands out as the one with the lowest count of products but the highest value per tokenized stock. Also, demand appears concentrated in a smaller set of recognizable stocks rather than distributed evenly across every available token.

Value per tokenized stock (USD, log scale)

Powered by  Alea

Figure 9 Product breadth vs value per tokenized stock

BNB Chain grew from \$145M in January to \$1.09B in market value after attracting both [xStocks](#) and bStocks. Avalanche reached \$351M as Securitize deployed SECZ across Avalanche and Solana. Robinhood Chain reached \$142M within three months of launch as activity soared and tokenized stocks found utility. Ethereum and Solana both more than doubled in absolute value, yet their combined market share fell because newer distribution channels grew faster.

Figure 10 Tokenized stock value by chain

Secondary trading activity still concentrates within a few ecosystems and issuers. bStocks generated 55% of spot DEX volume and BNB Chain settled 56%, while Robinhood represented 26.6% in both views. Solana differs, as its 14% share comes from several issuers, making it the most shared trading venue/chain.

Figure 11 Daily spot DEX volume by issuer and blockchain

Robinhood puts 41.3% of its active value in DeFi apps, versus 27.2% for xStocks and only 0.8% for Ondo. This also explains why Robinhood can rank higher than bStocks despite BNB Chain holding more tokenized-stock value. Still, most tokenized stocks sit outside DeFi, especially on the largest platforms like Ondo.

Figure 12 Tokenized-stock value deployed in DeFi, by issuer

SECZ accounts for \$281M, or 78.6%, of Securitize’s tokenized-stock value. EXOD contributes \$61.5M and CURR \$15M. One issuer-sponsored listing can therefore reach meaningful value size, especially when the token launches alongside the public stock.

# Chapter 8 • DeFi Overview

By Dimitris Pechlivanidis · Senior Analyst, Alea Research

Stock tokens can do more than sit in users' wallets. They can trade 24/7 in DEXs, supply them to trading pools, borrow against them, and use them in strategies that separate or reinvest their returns. Today most value sits in a small number of issuer-protocol venues, with lending deposits growing much faster than debt.

Uniswap V4 holds roughly two-thirds of Robinhood's deployed value. Pendle holds one-third of xStocks' total DeFi value through STRCx alone, while the rest spreads across Solana mainly. Lista Lending accounts for most bStocks deployment.

Figure 18 DeFi deployment by issuer and destination

Tokenized stock deposits have grown to almost \$80M, increasing by almost 25% over the past month. Solana lending markets hold most tokenized-equity collateral, led by Kamino's Superstate and xStocks markets. BNB Chain supports a broader set of smaller ListaDAO pools, while Robinhood Chain remains at an earlier stage.

Deposits exceed debt in every leading market. Kamino's Opening Bell and xStocks markets hold \$38M and \$29M of deposits, respectively, against \$7.5M and \$5.2M of debt. Debt equals less than 20% of deposits in both markets. Smaller Lista pools reach roughly 25% to 40%.

Figure 20 Deposits and debt in leading tokenized-stock lending markets

Kamino's loan to deposit ratio went up from 11% in January to roughly 34% in February and March, then fell to 18% as deposits grew faster than debt. Lista grew from 10% in its first week to almost 30% by September, while Morpho held near 29% through August before falling to 6.7%.

Few would have expected tokenized stocks to trade against memecoins, yet AI/NVDA and STONK/SPYx now rank among the three deepest stock-token pools with more pairs like this trading on Robinhood, BNB Chain, and Solana. Permissionless markets let users pair a familiar equity with a native speculative asset, using the stock token as collateral and a quote asset rather than simply holding it for price exposure.

Figure 22 Largest tokenized-stock liquidity pools

STRCx accounts for about one-third of xStocks' deployed DeFi value, and Pendle holds 97% of STRCx's DeFi balance. Pendle separates Strategy's discrete distributions from the principal position, allowing users to trade the income stream, take directional yield exposure or provide liquidity around both claims.
