Tokenized Stock Ecosystem: Overview Of Key Players

New platforms expanded the market beyond Ondo and xStocks in 2026 and created a multi-platform competitive landscape.

Figure 5 Tokenized stock platform ecosystem

Ondo and xStocks controlled **76.2%** of value in January. Today, Ondo and bStocks hold **53.4%** of the total market, with xStocks ranking third. New competitors such as bStocks and Robinhood reshaped the market, so six platforms now each hold roughly 5% or more. Distribution via exchanges, brokerages, and wallets now matters as much as first-mover advantage.

Figure 6 Platform share of tokenized stock value

Ondo's share fell from 61.4% in May to 28.4% in September. New entrants expanded while Ondo's distributed value declined by roughly 20%, amplifying the loss of market share. In the meantime, bStocks reached 25% within roughly 3 months.

Figure 7 Platform share of tokenized stock value over time

Robinhood's 334% increase partly reflects its small starting base, but it still added about \$120M of market value in 30 days. bStocks added even more in absolute terms at roughly \$173M. Recent growth came from new products, while several established platforms stayed flat or contracted.

Figure 8 30-day growth in tokenized stock value

xStocks, Reality, and Dinari offer large catalogs, but average value per product remains low. bStocks, Robinhood, and Ondo on the other hand, concentrate more capital in fewer products. Securitize stands out as the one with the lowest count of products but the highest value per tokenized stock. Also, demand appears concentrated in a smaller set of recognizable stocks rather than distributed evenly across every available token.

Value per tokenized stock (USD, log scale)

Figure 9 Product breadth vs value per tokenized stock

BNB Chain grew from \$145M in January to \$1.09B in market value after attracting both [xStocks](#) and bStocks. Avalanche reached \$351M as Securitize deployed SECZ across Avalanche and Solana. Robinhood Chain reached \$142M within three months of launch as activity soared and tokenized stocks found utility. Ethereum and Solana both more than doubled in absolute value, yet their combined market share fell because newer distribution channels grew faster.

Figure 10 Tokenized stock value by chain

Secondary trading activity still concentrates within a few ecosystems and issuers. bStocks generated 55% of spot DEX volume and BNB Chain settled 56%, while Robinhood represented 26.6% in both views. Solana differs, as its 14% share comes from several issuers, making it the most shared trading venue/chain.

Figure 11 Daily spot DEX volume by issuer and blockchain

Robinhood puts 41.3% of its active value in DeFi apps, versus 27.2% for xStocks and only 0.8% for Ondo. This also explains why Robinhood can rank higher than bStocks despite BNB Chain holding more tokenized-stock value. Still, most tokenized stocks sit outside DeFi, especially on the largest platforms like Ondo.

Figure 12 Tokenized-stock value deployed in DeFi, by issuer

SECZ accounts for \$281M, or 78.6%, of Securitize’s tokenized-stock value. EXOD contributes \$61.5M and CURR \$15M. One issuer-sponsored listing can therefore reach meaningful value size, especially when the token launches alongside the public stock.
